THERE IS
SOMETHING
IN OUR NAME
THAT BRINGS YOU
A FEELING OF
SECURITY.

CRUMPTON COMPANY.

Why do most NC physicians participate in the Crumpton Plan of Disability Income Protection?

THE ANSWER is the 47 years of successful relationship and personal service at claim time!

Yes, the feeling of security as well as economic advantage in knowing the program is a plan of carefully designed benefits.

The plan is not filled with a lot of "purple duck feathers," but provides income when you are unable to produce — not promises, but performance.

Why not call us today to obtain the latest details for your group practice? We are delighted to offer our broadened portfolio of professional insurance.

For professionals, a major disability or illness can be financial disaster.

A disability income protection plan from Connecticut Mutual replaces earnings lost because of disability.

Our plan includes:

- high benefit limits that replace more of your income;
- special reduced rates for non-smokers;
- proportionate benefits when you can only work part-time but still

need a full-time income;

—the ability to increase your basic policy benefit as your income increases, regardless of your health;

—reimbursement for vocational and educational expenses during rehabilitation;

—an "Own Occupation" rider that pays full benefits if you are unable to perform the main duties of your own occupation, even if you earn income from a different job or business;

—we can also pay dividends that

reduce the cost of your coverage.

Call today to find out how we can custom design a Blue Chip protection plan to keep your income healthy.

Not Just A Name Without A Face

For over 70 years, Saint Albans Hospital has offered the highest quality of psychiatric care.

At the center of this care are the fine physicians on the Active Medical Staff of Saint Albans Hospital. Their concern is reflected in the treatment given each and every patient. Through specialized programs for adolescents, senior adults, those with chemical dependencies and those with eating disorders, our physicians work to restore their patients to full recovery.

When you have a patient in need of psychiatric help, call one of our doctors, knowing your patient will receive the best care possible.

CARDIZEM[®] FEW SIDE EFFECTS diltiazem HCl/Marion IN ANTIANGINAL THERAPY

60 mg tid or qid

Brief Summary Professional Use Information

CARDIZEM[®]
(diltiazem HCl) 30 mg and 60 mg Tablets

CONTRAINDICATIONS

CARDIZEM is contraindicated in (1) patients with sick sinus syndrome except in the presence of a functioning ventricular pacemaker, (2) patients with second- or third-degree AV block except in the presence of a functioning ventricular pacemaker, and (3) patients with hypotension (less than 90 mm Hg systolic).

WARNINGS

1 Cardiac Conduction. CARDIZEM prolongs AV node refractory periods without significantly prolonging sinus node recovery time, except in patients with sick sinus syndrome. This effect may rarely result in abnormally slow heart rates (particularly in patients with sick sinus syndrome) or second- or third-degree AV block (six of 1,243 patients for 0.48%). Concomitant use of diltiazem with beta-blockers or digitalis may result in additive effects on cardiac conduction. A patient with Prinzmetal's angina developed periods of asystole (2 to 5 seconds) after a single dose of 60 mg of diltiazem.

2 Congestive Heart Failure. Although diltiazem has a negative inotropic effect in isolated animal tissue preparations, hemodynamic studies in humans with normal ventricular function have not shown a reduction in cardiac index nor consistent negative effects on contractility (dp/dt).

Experience with the use of CARDIZEM alone or in combination with beta-blockers in patients with impaired ventricular function is very limited. Caution should be exercised when using the drug in such patients.

3 Hypotension. Decreases in blood pressure associated with CARDIZEM therapy may occasionally result in symptomatic hypotension.

4 Acute Hepatic Injury. In rare instances, significant elevations in enzymes such as alkaline phosphatase, CPK, LDH, SGOT, SGPT, and other symptoms consistent with acute hepatic injury have been noted. These reactions have been reversible upon discontinuation of drug therapy. The relationship to CARDIZEM is uncertain in most cases, but probable in some. (See PRECAUTIONS.)

PRECAUTIONS

General. CARDIZEM (diltiazem hydrochloride) is extensively metabolized by the liver and excreted by the kidneys and in bile. As with any new drug given over prolonged periods, laboratory parameters should be monitored at regular intervals. The drug should be used with caution in patients with impaired renal or hepatic

function. In subacute and chronic dog and rat studies designed to produce toxicity, high doses of diltiazem were associated with hepatic damage. In special subacute hepatic studies, oral doses of 125 mg/kg and higher in rats were associated with histological changes in the liver which were reversible when the drug was discontinued. In dogs, doses of 20 mg/kg were also associated with hepatic changes; however, these changes were reversible with continued dosing.

Drug Interaction. Pharmacologic studies indicate that there may be additive effects in prolonging AV conduction when using beta-blockers or digitalis concomitantly with CARDIZEM. (See WARNINGS.)

Controlled and uncontrolled domestic studies suggest that concomitant use of CARDIZEM and beta-blockers or digitalis is usually well tolerated. Available data are not sufficient, however, to predict the effects of concomitant treatment, particularly in patients with left ventricular dysfunction or cardiac conduction abnormalities. In healthy volunteers, diltiazem has been shown to increase serum digoxin levels up to 20%.

Carcinogenesis, Mutagenesis, Impairment of Fertility. A 24-month study in rats and a 21-month study in mice showed no evidence of carcinogenicity. There was also no mutagenic response in *in vitro* bacterial tests. No intrinsic effect on fertility was observed in rats.

Pregnancy. Category C. Reproduction studies have been conducted in mice, rats, and rabbits. Administration of doses ranging from five to ten times greater (on a mg/kg basis) than the daily recommended therapeutic dose has resulted in embryo and fetal lethality. These doses, in some studies, have been reported to cause skeletal abnormalities. In the perinatal/postnatal studies, there was some reduction in early individual pup weights and survival rates. There was an increased incidence of stillbirths at doses of 20 times the human dose or greater.

There are no well-controlled studies in pregnant women; therefore, use CARDIZEM in pregnant women only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers. Diltiazem is excreted in human milk. One report suggests that concentrations in breast milk may approximate serum levels. If use of CARDIZEM is deemed essential, an alternative method of infant feeding should be instituted.

Pediatric Use. Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

Serious adverse reactions have been rare in studies carried out to date, but it should be recognized that patients with impaired ventricular function and cardiac conduction abnormalities have usually been excluded.

In domestic placebo-controlled trials, the incidence of adverse reactions reported during CARDIZEM therapy was not greater than that reported during placebo therapy.

The following represent occurrences observed in clinical studies which can be at least reasonably asso-

ciated with the pharmacology of calcium influx inhibition. In many cases, the relationship to CARDIZEM has not been established. The most common occurrences as well as their frequency of presentation are: edema (2.4%), headache (2.1%), nausea (1.9%), dizziness (1.5%), rash (1.3%), asthenia (1.2%). In addition, the following events were reported infrequently (less than 1%):

Cardiovascular	Angina, arrhythmia, AV block (first degree), AV block (second or third degree — see conduction warning), bradycardia, congestive heart failure, flushing, hypotension, palpitations, syncope.
Nervous System	Amnesia, gait abnormality, hallucinations, insomnia, nervousness, paresthesia, personality change, somnolence, tinnitus, tremor.
Gastrointestinal	Anorexia, constipation, diarrhea, dyspepsia, dyspepsia, mild elevations of alkaline phosphatase, SGOT, SGPT, and LDH (see hepatic warnings), vomiting, weight increase.
Dermatologic	Petechiae, pruritus, photosensitivity, urticaria.
Other	Amblyopia, dyspnea, epistaxis, eye irritation, hyperglycemia, nasal congestion, nocturia, osteoarticular pain, polyuria, sexual difficulties.

The following postmarketing events have been reported infrequently in patients receiving CARDIZEM: alopecia, gingival hyperplasia, erythema multiforme, and leukopenia. However, a definitive cause and effect between these events and CARDIZEM therapy is yet to be established. **Issued 7/86**

To Test or Not To Test

Issues in Community Screening for Human Immunodeficiency Virus

Suzanne Landis, M.D., M.P.H.

Prevention of the spread of AIDS and reduction in the reservoir of high risk individuals is a major priority in public health currently and will continue to be so in the coming decade. Successful management of the disease will require integration of classic public health methods of disease surveillance and infection control with emerging principles of lifestyle modification. One aspect of disease surveillance is detection of persons who are asymptomatic but infected with human immunodeficiency virus (HIV). Mass screening, either voluntary or mandatory, has been discussed by some North Carolina legislators¹ and health care professionals^{2,3} as a means of reducing HIV transmission; this assumes that all those knowledgeable about their infection status will significantly change their behavior in an effort to reduce the transmission of the virus.

Knowledge of HIV infection personalizes risk reduction instruction and underscores the need for avoiding unprotected intercourse. Knowledge of positive serostatus also enables the individual to:

- a. Inform prospective and previous sexual partners.
- b. Avoid pregnancy and breast feeding.
- c. Alert his/her health care providers to the possible role of HIV infection in evaluating any nonspecific medical symptoms or signs (e.g., recognition and treatment of life-threatening opportunistic infections such as *Pneumocystis carinii* pneumonia).
- d. Begin prophylactic chemotherapy with isoniazid if a tuberculin test is positive and clinically active tuberculosis is excluded.
- e. Prolong treatment for active pulmonary tuberculosis to at least six months beyond a negative sputum culture.¹
- f. Avoid certain live viral or bacterial vaccines and immunosuppressive therapy, depending on the extent of clinical symptoms for AIDS.⁴⁻⁶

g. Attempt to decrease exposure to other viruses such as cytomegalovirus, Epstein-Barr virus and *Herpes simplex*-virus, in an attempt to slow the progression of HIV infection.⁷⁻¹¹

A seronegative individual may also benefit from screening by:

- a. Being assured that he/she is probably not infected and is therefore unlikely to transmit the virus to others.
- b. Receiving personal risk reduction counseling based on specific high risk activities.

I will evaluate whether a mass screening program for HIV infection will do more good than harm, by using the seven guidelines set forth by Cadman et al. (table 1,¹² next page).

1. Has the effectiveness of an HIV screening program been demonstrated in a randomized trial?

Are there any trials in which unselected persons have been randomly allocated to be *offered* or *not offered* screening and in which those with positive screenings (ELISA tests and Western blot tests) are then encouraged to proceed to staging of the disease and to undergo counseling to identify high-risk behaviors? In such a study, the control group would *not* undergo screening and their HIV infection would be detected only when it became symptomatic, i.e., AIDS.

An effectiveness study should consider the broader outcomes of general health and well-being and should consider whether a "socially significant" difference in outcome is found between the screened and the control persons. Some outcomes which might be important in a screening program for HIV infection are:

- a. Reduction in transmission of HIV in the screened group as compared to the control group.
- b. Significant changes in high risk behavior associated with knowledge of serologic status.
- c. A prolongation of the asymptomatic state before overt AIDS develops, accounting for the "lead time" from early diagnosis.

From Department of Epidemiology, School of Public Health, and Department of Medicine, University of North Carolina, Chapel Hill 27514. Presented as part of a panel discussion at the 15th Annual Alumni Conference of the University of North Carolina School of Public Health, Chapel Hill, April 1987.

Table 1

Seven Guidelines for Deciding Whether an HIV Community Screening Program Does More Good than Harm

Guidelines		Comments	
1	Has the program's effectiveness been demonstrated in a randomized trial? <i>If an effectiveness trial with a positive result has not been carried out, ask the following questions:</i>	1	No.
2	Are efficacious treatments available?	2	No proven efficacious antiviral agents to treat asymptomatic HIV infection are available.
3	Does the current burden of suffering warrant screening?	3	HIV infection is a devastating illness.
4	Is there a good screening test?	4	In the general population, the screening tests (ELISA, followed by a Western blot) might identify many persons who are false positives.
5	Does the program reach those who could benefit from it?	5	Voluntary screening programs for HIV in North Carolina have identified approximately 2% of the estimated number of seropositive persons.
6	Can the health system cope with the screening program?	6	An expanded voluntary or a mandatory screening program would stress our current public health system.
7	Will those who had a positive screening comply with subsequent advice and interventions?	7	Education and counseling do not necessarily result in appropriate changes in high-risk behavior.

Adapted from: Assessing the effectiveness of community screening programs. JAMA 1984;251:1580-5. Copyright 1984, American Medical Association.

d. Adverse psychosocial reactions to the knowledge of HIV seropositivity.

e. Reduction in the medical care cost of patients with AIDS through early detection.

No clinical trial has been done measuring the above outcomes in the general population. In the absence of data we must, therefore, examine other criteria to answer the question of whether an HIV-screening program will do more good than harm.

2. Are there efficacious treatments for asymptomatic HIV infection and/or efficacious preventive maneuvers for the transmission of HIV?

Are there behavioral modification techniques to prevent progression from asymptomatic HIV infection to overt AIDS, or to reduce transmission of the virus? Are there agents to prevent progression from asymptomatic HIV infection to overt AIDS? No randomized controlled studies exist to answer these questions. However, Fox et al. note that homosexual/bisexual males who wish to know their serologic status and are seropositive have significantly reduced their number of partners by 50% six months later.¹³

Education in the form of mass media campaigns has been a prime strategic tool for the control of the AIDS epidemic in homosexual communities even without mass HIV screening programs; McKusick, et al. in San Francisco found that men in nonmonogamous relationships and men not in relationships reported substantial reductions in high-risk sexual activity.¹⁴

However, Echenberg has suggested that educational campaigns may not be effective in the heterosexual community

because the perceived threat of AIDS is not as great as in homosexual communities with a high prevalence.¹⁵ Knowledge of serologic status along with personalized risk-reduction counseling may be necessary to change heterosexuals' behaviors.¹⁵ Heterosexual couples in which one partner is seropositive are encouraged to practice safe sex, including the use of condoms; it is surprising that among such couples as many as 37.5% (12/32) may not adhere to this recommendation.¹⁶ Thus, knowledge of a positive blood test for HIV does not necessarily lead to appropriate changes in behavior and, likewise, knowledge of high-risk behavior for AIDS does not necessarily result in alteration of that behavior.

At present there are no proven effective antiretroviral treatments to delay progression to overt AIDS. We also have no scientifically rigorous information from clinical trials to demonstrate that avoiding exposure to foreign antigens will delay progression to overt AIDS. There are some suggestive and theoretical data, however; we therefore counsel seropositive persons to try to avoid infections with cytomegalovirus, Epstein-Barr virus, and *Herpes simplex virus*.⁷⁻¹¹

3. Does the current burden of suffering warrant screening?

Does the asymptomatic HIV infection substantially impair the present or future physical, social, emotional and/or intellectual function of the person and/or his family? Numerous reports have suggested significant social and emotional dysfunction associated with knowledge of HIV seropositivity even without physical disability.¹⁷⁻¹⁹

As many as 34% of persons who are HIV seropositive

Table 2

The Effect of Prevalence on the Predictive Value of HIV Antibody (ELISA) Screening
(Sensitivity = .993; Specificity = .998)

Definitive Diagnosis of HIV Infection									
HIV Test Result	Present			Absent			Total		
Positive	199	2,000	2,199	1,986	1,996	3,982	19,860	1,960	21,820
Negative	1	997,800	997,801	14	996,004	996,018	140	978,040	978,180
	200	999,800	1,000,000	2,000	998,004	1,000,000	20,000	980,000	1,000,000
	Prevalence 0.02%			Prevalence 0.2%			Prevalence 2%		
	PPV = $\frac{199}{2,199} = 9\%$			PPV = $\frac{1,986}{3,982} = 50\%$			PPV = $\frac{19,860}{21,820} = 91\%$		

have developed AIDS within three years.^{20, 21} These figures vary based on the risk group studied and their geographic location.²⁰ Early diagnosis of the asymptomatic state, if there were effective treatments, would certainly be appropriate.

Dr. R. Meriwether, head of the communicable Disease Branch of the North Carolina Department of Human Resources, estimates that 0.02% of the general population in North Carolina is infected with HIV.¹ HIV infection is not common, but when it does occur it is a psychosocially debilitating and often progressive illness.

4. Is there a good screening test?

The test must have a high sensitivity (yielding a positive result in a high proportion of persons who actually have HIV infection) and a high specificity (yielding a negative result in a high proportion of those who do not have the infection). The ELISA screening test, an enzyme-linked immunosorbent assay which detects antibodies to HIV, has been known to have a high sensitivity and a high specificity, 99.3% and 99.8%, respectively, according to the CDC and the manufacturers.⁽²²⁻²⁶⁾

The second aspect of the ELISA screening test which is important is the positive predictive value. This is the probability that a patient with a positive HIV ELISA test actually is infected. For clinicians and counselors, this is the most relevant concept. A person who has a positive ELISA test will ask whether he/she truly has HIV infection. As the true prevalence of HIV infection in a population increases, the positive predictive value correspondingly increases (table 2).

In a population with a prevalence of 0.02% (the approximate prevalence in the general population in North Carolina) the positive predictive value of a repeatedly reactive ELISA test is 9% (table 2). Thus 91% of people in the general population of North Carolina with a positive ELISA will have a falsely positive test, i.e., they do not have HIV infection even though the test is positive. It is obvious that this test, even though extremely sensitive and specific, does

not perform well in a population where the prevalence of HIV infection is extremely low.

When the prevalence is 0.2%, the positive predictive value rises to 50%; when the prevalence increases to 2%, which might be the prevalence in sexually transmitted disease clinics, the positive predictive value increases further to 91%. When the prevalence increases to 10% or 11%, which is the prevalence of seropositivity at alternate test sites in North Carolina, the positive predictive value increases to almost 99%.

It is obvious then that a most crucial factor in deciding whether or not the test accurately predicts true positivity will be the prevalence of HIV infection in the tested population. In a population in which the prevalence is 0.2% or less, the ELISA screening test is not very accurate.

In general, once a blood sample is repeatedly positive by the ELISA screening test, it is further analyzed by use of the Western blot.²⁷ The Western blot test is a research tool and does not use commercially standardized reagents. Therefore, the sensitivity and specificity have not been addressed. However, the test is felt to be, in the best of hands, more sensitive and specific than the ELISA test.²⁸ In table 3 (next page), the improvement in positive predictive value is evident when the Western blot method is used to confirm the positive samples detected with the ELISA. Included are two values for sensitivity and specificity of the Western blot.* By sequentially testing blood with ELISA and then with the Western blot, one can significantly improve positive predictive value.** Comparison between part B and part C in table 3 illustrates that by an increase of more than 6% in specificity, holding prevalence of the infection constant, the positive predictive value can be improved by at least 40%. Clinicians and counselors should realize that the

*These values are hypothetical and *should not* be interpreted as the sensitivity and specificity of the Western blot test. However, these are based on communication with Dr. Tsang and reports in the literature.²⁸⁻³¹

**The Western blot test is assumed for the calculations in table 3 to be an independent test from the ELISA. Since this may not be totally correct, the positive predictive value for the Western blot testing in table 3 might be slightly higher than the true value.³²

Table 3

A. ELISA Test (Sensitivity = .993; Specificity = .998; 0.02% Prevalence HIV in Population)

Definitive Diagnosis of HIV Infection

<i>HIV Test Result</i>	<i>Present</i>	<i>Absent</i>		
Positive	199	2,000	2,199	
Negative	1	997,800	997,801	PPV = 9%
	200	999,800	1,000,000	

B. Western Blot (test the positives from A; Sensitivity = .99 and Specificity = .93)

Definitive Diagnosis of HIV Infection

<i>HIV Test Result</i>	<i>Present</i>	<i>Absent</i>		
Positive	197	140	337	
Negative	2	1,860	1,862	PPV = 58%
	199	2,000	2,199	

C. Western Blot (test the positives from A; Sensitivity = .99 and Specificity = .998)

Definitive Diagnosis of HIV Infection

<i>HIV Test Result</i>	<i>Present</i>	<i>Absent</i>		
Positive	197	4	201	
Negative	2	1,996	1,998	PPV = 98%
	199	2,000	2,199	

majority of people, even in a low prevalence population, who are ELISA positive *and* Western blot positive, are truly infected with HIV; however, a certain proportion of seropositive persons will still be false positives.

5. Does the program reach a high proportion of persons for whom it was intended?

Screening programs aimed at the general population are particularly susceptible to the "inverse care law," where those in greatest need tend to be the least likely to be screened.

Alternate test site programs have been set up to anonymously test persons who perceive themselves to be at high risk for AIDS. One hundred ninety-seven cases of AIDS have been diagnosed in North Carolina.¹ If we estimate that there are 50 seropositive people per AIDS case, 9,850 seropositive people currently live in North Carolina. Since alternate test site screening has begun in 1985, approximately 2,000 people have been tested.¹ Of these 2,000 who have been tested, approximately 10% have been seropositive.² Therefore, only about 2% of the estimated number of seropositive people in North Carolina have been tested to date. It is likely that if a voluntary mass screening program for HIV infection were instituted, very few people who needed to be tested would actually volunteer for testing.

Table 4**Costs of MASS Screening**

290,000	persons in Wake County (1980) between 20 and 65 years
72,500	1/4 of population is screened
36,250	hours of counseling required (1/2 hr of counseling per client)
\$507,500	Counseling fees (\$14/hr PHN salary) (equivalent to 17 PHN slots)
\$1,120,300	Lab costs [using \$15 per ELISA and \$28 per Western blot and performing 74,500 ELISA (includes 2,000 repeats) and 100 Western blot confirmatory tests]
\$1,627,800	TOTAL COST to detect about 15 seropositive persons, if prevalence is 0.02%
\$108,520	DETECTION COST PER SEROPOSITIVE PERSON. IF ONLY 9 OF THESE PERSONS ARE TRUE POSITIVES, THE COST PER TRUE CASE IS INCREASED TO:
\$180,867	

6. Can the health system cope with the screening program?

All persons with positive HIV tests (ELISA and Western blot) must have further diagnostic evaluations to determine the stage of the infection and have followup evaluations periodically.

Table 4 demonstrates the possible cost of mass screening. By the 1980 census, there were approximately 290,000 persons in Wake County between the ages of 20 and 65. If one quarter of this population came forward for screening during the first year, 72,500 people would be screened. If one half hour of counseling is required per client, 36,250 hours of counseling would result with a cost of approximately \$507,500. This is equivalent to 17 full-time public health

nursing slots which would need to be added to the current Wake County Health Department staff. Lab costs, using \$15 per ELISA and \$28 per Western blot, would result in approximately \$1,120,300, for a total cost of \$1,627,800.[†] This is the total cost to detect about 15 seropositive persons if the true prevalence is .002% in the population. This results in a detection cost of \$108,520 per seropositive person. If the specificity of the Western blot confirmatory test is extremely high, most of these people will be true positives. However, if only nine of these 15 are true positives (based on a 93% specificity of the Western blot) the cost per true case is increased to \$180,867. This is obviously a significant amount of money and expansion in personnel to detect a disorder for which there is no effective therapy.

If an effective therapy for asymptomatic HIV infections is discovered, the above estimated cost of detection may well be worth it. Hardy, et al., in evaluating 10,000 AIDS cases, concluded that \$630,000 per person is spent in hospital costs and in income lost due to disability.³³ The cost of AIDS is great, as is the cost of community screening. Society must determine at what level detection costs outweigh the costs of treating AIDS cases.

7. Will those with positive HIV antibody tests comply with control measures?

In general, screening programs typically are directed toward the detection of presymptomatic chronic conditions. Persons with chronic conditions sometimes demonstrate poor compliance with recommended therapies such as weight reduction and hypertension control.³⁴ Currently we have no proven antiretroviral treatment to prevent progression from asymptomatic HIV infection to AIDS. Furthermore, alteration in high risk behavior might reduce the spread of HIV, but this change must be maintained for the person's entire lifespan. We do not have adequate information about the ability of persons to change their sexual behavior over periods longer than two years.^{13,14} Heterosexual couples in which one spouse is HIV seropositive have not uniformly used condoms or practiced safe sex.¹⁶ Infected women who have delivered children who subsequently developed AIDS have not uniformly refrained from getting pregnant again.³⁵ Thus we do not know how a mass screening program for HIV infection will affect those people identified as seropositive.

Summary

AIDS is a devastating disease. Many persons infected with HIV will progress to overt AIDS. A screening program

aimed at the general population would identify varying numbers of persons who are false positive, depending on the sensitivity and specificity of the confirmatory Western blot test and the prevalence of HIV infection in the population. The cost of such a screening program would be extremely high, considering that no proven treatment is available for asymptomatic HIV infections. A mass screening program is fraught with problems and would not do more good than harm.

If high risk populations are selected, where the prevalence of HIV infection is above 1% or 2%, the accuracy of the screening tests is improved and the cost of detecting a seropositive person decreases. Ethical issues and implementation concerns then become important as legislators and some public health personnel consider mandatory targeted screening for selected groups such as prostitutes, intravenous drug users, prisoners, or high risk women who might become pregnant.³⁶ ■

Once-a-day

Rocephin[®]

IV·IM

ceftriaxone sodium/Roche

* ROCEPHIN is indicated in the following infections: bacterial septicemia, bone and joint, intra-abdominal, lower respiratory tract, skin and skin structure, urinary tract, bacterial meningitis and gonorrhea. Please see summary of product information on adjacent page for indicated susceptible organisms.

Rocephin® IV·IM

ceftriaxone sodium/Roche

Before prescribing, please consult complete product information, a summary of which follows:

MICROBIOLOGY. The bactericidal activity of ceftriaxone results from inhibition of cell wall synthesis. Ceftriaxone has a high degree of stability in the presence of beta lactamases; both penicillinases and cephalosporinases, of gram-negative and gram-positive bacteria. Ceftriaxone is usually active against the following microorganisms *in vitro* and in clinical infections (see Indications and Usage):

GRAM-NEGATIVE AEROBES: *Enterobacter aerogenes*, *Enterobacter cloacae*, *Escherichia coli*, *Haemophilus influenzae* (including ampicillin-resistant strains), *H. parainfluenzae*, *Klebsiella* species (including *K. pneumoniae*), *Neisseria gonorrhoeae* (including penicillinase and nonpenicillinase producing strains), *Neisseria meningitidis*, *Proteus mirabilis*, *Proteus vulgaris*, *Morganella morganii* and *Serratia marcescens*.

Note: Many strains of the above organisms that are multiply resistant to other antibiotics, e.g., penicillins, cephalosporins and aminoglycosides, are susceptible to ceftriaxone sodium.

Ceftriaxone is also active against many strains of *Pseudomonas aeruginosa*.

GRAM-POSITIVE AEROBES: *Staphylococcus aureus* (including penicillinase-producing strains) and *Staphylococcus epidermidis* (Note: methicillin-resistant staphylococci are resistant to cephalosporins, including ceftriaxone), *Streptococcus pyogenes* (Group A beta hemolytic streptococci), *Streptococcus agalactiae* (Group B streptococci) and *Streptococcus pneumoniae* (Note: Most strains of enterococci, *Streptococcus faecalis* and Group D streptococci are resistant).

Ceftriaxone also demonstrates *in vitro* activity against the following microorganisms, although the clinical significance is unknown:

GRAM-NEGATIVE AEROBES: *Citrobacter freundii*, *Citrobacter diversus*, *Providencia* species (including *Providencia rettgeri*), *Salmonella* species (including *S. typhi*), *Shigella* species and *Acinetobacter calcoaceticus*.

ANAEROBES: *Bacteroides* species, *Clostridium* species (Note: most strains of *C. difficile* are resistant).

SUSCEPTIBILITY TESTING. Standard susceptibility disk method. Quantitative methods that require measurement of zone diameters give the most precise estimate of antibiotic susceptibility. One such procedure (Bauer AW Kirby WM Sherris JC, Turk M. Antibiotic Susceptibility Testing by a Standardized Single Disk Method. *Am J Clin Pathol* 45:493-496, 1966. Standardized Disk Susceptibility Test. Federal Register 39:19162-19164, 1974. National Committee for Clinical Laboratory Standards. Approved Standard. ASM 2. Performance Standards for Antimicrobial Disk Susceptibility Tests, July 1975) has been recommended for use with disks to test susceptibility to ceftriaxone.

Laboratory results of the standardized single-disk susceptibility test using a 30 mcg ceftriaxone disk should be interpreted according to the following three criteria:

1. Susceptible organisms produce zones of 18 mm or greater, indicating that the tested organism is likely to respond to therapy.
2. Organisms that produce zones of 14 to 17 mm are expected to be susceptible if a high dosage (not to exceed 4 gm per day) is used or if the infection is confined to tissues and fluids (e.g., urine), in which high antibiotic levels are attained.
3. Resistant organisms produce zones of 13 mm or less, indicating that other therapy should be selected. Organisms should be tested with the ceftriaxone disk, since ceftriaxone has been shown by *in vitro* tests to be active against certain strains found resistant to cephalosporin class disks.

Organisms having zones of less than 18 mm around the cephalothin disk are not necessarily of intermediate susceptibility or resistant to ceftriaxone.

Standardized procedures require use of control organisms. The 30 mcg ceftriaxone disk should give zone diameters between 29 and 35 mm, 22 and 28 mm and 17 and 23 mm for the reference strains *E. coli* ATCC 25922, *S. aureus* ATCC 25923 and *P. aeruginosa* ATCC 27853, respectively.

DILUTION TECHNIQUES. Based on the pharmacokinetic profile of ceftriaxone, a bacterial isolate may be considered susceptible if the MIC value for ceftriaxone is not more than 16 mcg/ml. Organisms are considered resistant to ceftriaxone if the MIC is equal to or greater than 64 mcg/ml. Organisms having an MIC value of less than 64 mcg/ml, but greater than 16 mcg/ml, are expected to be susceptible if a high dosage (not to exceed 4 gm per day) is used or if the infection is confined to tissues and fluids (e.g., urine), in which high antibiotic levels are attained.

E. coli ATCC 25922, *S. aureus* ATCC 25923 and *P. aeruginosa* ATCC 27853 are also the recommended reference strains for controlling ceftriaxone dilution tests. Greater than 95% of MICs for the *E. coli* strain should fall within the range of 0.016 to 0.5 mcg/ml. The range for the *S. aureus* strain should be 1 to 2 mcg/ml, while for the *P. aeruginosa* strain the range should be 8 to 64 mcg/ml.

INDICATIONS AND USAGE: Rocephin is indicated for the treatment of the following infections when caused by susceptible organisms:

LOWER RESPIRATORY TRACT INFECTIONS caused by *Strep. pneumoniae*, *Streptococcus* species (excluding enterococci), *Staph. aureus*, *H. influenzae*, *H. parainfluenzae*, *Klebsiella* species (including *K. pneumoniae*), *E. coli*, *E. aerogenes*, *Proteus mirabilis* and *Serratia marcescens*.

SKIN AND SKIN STRUCTURE INFECTIONS caused by *Staph. aureus*, *Staph. epidermidis*, *Streptococcus* species (excluding enterococci), *E. cloacae*, *Klebsiella* species (including *K. pneumoniae*), *Proteus mirabilis* and *Pseudomonas aeruginosa*.

URINARY TRACT INFECTIONS (complicated and uncomplicated) caused by *E. coli*, *Proteus mirabilis*, *Proteus vulgaris*, *M. morganii* and *Klebsiella* species (including *K. pneumoniae*).

UNCOMPLICATED GONORRHEA (cervical, urethral and rectal) caused by *Neisseria gonorrhoeae*, including both penicillinase and nonpenicillinase producing strains.

PELVIC INFLAMMATORY DISEASE caused by *N. gonorrhoeae*.

BACTERIAL SEPTICEMIA caused by *Staph. aureus*, *Strep. pneumoniae*, *E. coli*, *H. influenzae* and *K. pneumoniae*.

BONE AND JOINT INFECTIONS caused by *Staph. aureus*, *Strep. pneumoniae*, *Streptococcus* species (excluding enterococci), *E. coli*, *P. mirabilis*, *K. pneumoniae* and *Enterobacter* species.

INTRA-ABDOMINAL INFECTIONS caused by *E. coli* and *K. pneumoniae*.

MENINGITIS caused by *H. influenzae*, *N. meningitidis* and *Strep. pneumoniae*. Ceftriaxone has also been used successfully in a limited number of cases of meningitis and shunt infections caused by *Staph. epidermidis* and *E. coli*.

PROPHYLAXIS. The administration of a single dose of ceftriaxone preoperatively may reduce the incidence of postoperative infections in patients undergoing coronary artery bypass surgery.

Although ceftriaxone has been shown to have been as effective as cefazolin in the prevention of infection following coronary artery bypass surgery, no placebo-controlled trials have been conducted to evaluate any cephalosporin antibiotic in the prevention of infection following coronary artery bypass surgery.

SUSCEPTIBILITY TESTING. Before instituting treatment with Rocephin, appropriate specimens should be obtained for isolation of the causative organism and for determination of its susceptibility to the drug. Therapy may be instituted prior to obtaining results of susceptibility testing.

CONTRAINDICATIONS. Rocephin is contraindicated in patients with known allergy to the cephalosporin class of antibiotics.

WARNINGS. BEFORE THERAPY WITH ROCEPHIN IS INSTITUTED, CAREFUL INQUIRY SHOULD BE MADE TO DETERMINE WHETHER THE PATIENT HAS HAD PREVIOUS HYPERSENSITIVITY REACTIONS TO CEPHALOSPORINS, PENICILLINS OR OTHER DRUGS. THIS PRODUCT SHOULD BE GIVEN CAUTIOUSLY TO PENICILLIN SENSITIVE PATIENTS. ANTIBIOTICS SHOULD BE ADMINISTERED WITH CAUTION TO ANY PATIENT WHO HAS DEMONSTRATED SOME FORM OF ALLERGY, PARTICULARLY TO DRUGS. SERIOUS ACUTE HYPERSENSITIVITY REACTIONS MAY REQUIRE THE USE OF SUBCUTANEOUS EPINEPHRINE AND OTHER EMERGENCY MEASURES.

Pseudomembranous colitis has been reported with the use of cephalosporins (and other broad spectrum antibiotics); therefore, it is important to consider its diagnosis in patients who develop diarrhea in association with antibiotic use.

ROCEPHIN® (ceftriaxone sodium/Roche)

Treatment with broad spectrum antibiotics alters the normal flora of the colon and may permit overgrowth of clostridia. Studies indicate a toxin produced by *Clostridium difficile* is one primary cause of antibiotic associated colitis. Clostridial toxins and colitis have been shown to bind to the toxin *in vitro*.

Mild cases of colitis respond to drug discontinuance alone. Moderate to severe cases should be managed with fluid, electrolyte and protein supplementation as indicated.

When the colitis is not relieved by drug discontinuance or when it is severe, oral vancomycin is the treatment of choice for antibiotic-associated pseudomembranous colitis produced by *C. difficile*. Other causes of colitis should also be considered.

PRECAUTIONS. GENERAL. Although transient elevations of BUN and serum creatinine have been observed at the recommended dosages, the nephrotoxic potential of Rocephin is similar to that of other cephalosporins.

Ceftriaxone is excreted via both biliary and renal excretion (see Clinical Pharmacology). Therefore, patients with renal failure normally require no adjustment in dosage when usual doses of Rocephin are administered, but concentrations of drug in the serum should be monitored periodically if evidence of accumulation exists, dosage should be decreased accordingly.

Dosage adjustments should not be necessary in patients with hepatic dysfunction, however, in patients with both hepatic dysfunction and significant renal disease, Rocephin dosage should not exceed 2 gm daily without close monitoring of serum concentrations.

Alterations in prothrombin times have occurred rarely in patients treated with Rocephin. Patients with impaired vitamin K synthesis of low vitamin K stores (e.g., chronic hepatic disease and malnutrition) may require monitoring of prothrombin time during Rocephin treatment. Vitamin K administration (10 mg weekly) may be necessary if the prothrombin time is prolonged before or during therapy.

Prolonged use of Rocephin may result in overgrowth of non-susceptible organisms. Careful observation of the patient is essential. If superinfection occurs during therapy, appropriate measures should be taken.

Rocephin should be prescribed with caution in individuals with a history of gastrointestinal disease especially colitis.

CARCINOGENESIS, MUTAGENESIS, IMPAIRMENT OF FERTILITY. Carcinogenesis: Considering the maximum duration of treatment and the class of the compound, carcinogenicity studies with ceftriaxone in animals have not been performed. The maximum duration of animal toxicity studies was six months. Mutagenesis: Genetic toxicology tests included the Ames test, a micronucleus test and a test for chromosomal aberrations in human lymphocytes cultured *in vitro* with ceftriaxone. Ceftriaxone showed no potential for mutagenic activity in these studies.

Impairment of Fertility. Ceftriaxone produced no impairment of fertility when given intravenously to rats at daily doses up to 586 mg/kg/day, approximately 20 times the recommended clinical dose of 2 gm/day.

PREGNANCY. Teratogenic Effects: Pregnancy Category B. Reproductive studies have been performed in mice and rats at doses up to 20 times the usual human dose and have no evidence of embryotoxicity, fetotoxicity or teratogenicity in primates; no embryotoxicity, or teratogenicity was demonstrated at a dose approximately three times the human dose.

There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproductive studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Nonteratogenic Effects. In rats, in the Segment I (fertility and general reproduction) and Segment III (perinatal and postnatal) studies with intravenously administered ceftriaxone, no adverse effects were noted on various reproductive parameters during gestation and lactation, including postnatal growth, functional behavior and reproductive ability of the offspring at doses of 586 mg/kg/day or less.

NURSING MOTHERS. Low concentrations of ceftriaxone are excreted in human milk. Caution should be exercised when Rocephin is administered to a nursing woman.

PEDIATRIC USE. Safety and effectiveness of Rocephin in neonates, infants and children have been established for the dosages described in the Dosage and Administration section.

ADVERSE REACTIONS. Rocephin is generally well tolerated. In clinical trials, the following adverse reactions, which were considered to be related to Rocephin therapy or of uncertain etiology, were observed:

LOCAL REACTIONS—pain, induration or tenderness at the site of injection (1%). Less frequently reported (less than 1%) was phlebitis after IV administration.

HYPERSENSITIVITY—rash (17%). Less frequently reported (less than 1%) were pruritus, fever or chills.

HEMATOLOGIC—eosinophilia (6%), thrombocytosis (51%) and leukopenia (21%). Less frequently reported (less than 1%) were anemia, neutropenia, lymphopenia, thrombocytopenia and prolongation of the prothrombin time.

GASTROINTESTINAL—diarrhea (27%). Less frequently reported (less than 1%) were nausea or vomiting, and dysgeusia.

HEPATIC—elevations of SGOT (31%) or SGPT (33%). Less frequently reported (less than 1%) were elevations of alkaline phosphatase and bilirubin.

RENAL—elevations of the BUN (12%). Less frequently reported (less than 1%) were elevations of creatinine and the presence of casts in the urine.

CENTRAL NERVOUS SYSTEM—headache or dizziness were reported occasionally (less than 1%).

GENITOURINARY—moniliasis or vaginitis were reported occasionally (less than 1%).

MISCELLANEOUS—diaphoresis and flushing were reported occasionally (less than 1%).

Other rarely observed adverse reactions (less than 0.1%) include leukocytosis, lymphocytosis, monocytosis, basophilia, a decrease in the prothrombin time, jaundice, glycosuria, hematuria, bronchospasm, skin sickness, abdominal pain, colitis, flatulence, dyspepsia, palpitations and epistaxis.

DOSEAGE AND ADMINISTRATION. Rocephin may be administered intravenously or intramuscularly. The usual adult daily dose is 1 to 2 gm given once a day (or in equally divided doses twice a day) depending on the type and severity of the infection. The total daily dose should not exceed 4 grams.

For the treatment of serious miscellaneous infections in children, other than meningitis, the recommended total daily dose is 50 to 75 mg/kg (not to exceed 2 grams) given in divided doses every 12 hours.

Generally, Rocephin therapy should be continued for at least two days after the signs and symptoms of infection have disappeared. The usual duration is 4 to 14 days, in complicated infections longer therapy may be required.

In the treatment of meningitis, a daily dose of 100 mg/kg (not to exceed 4 grams), given in divided doses every 12 hours, should be administered with or without a loading dose of 75 mg/kg.

For the treatment of uncomplicated gonococcal infections, a single intramuscular dose of 250 mg is recommended.

For preoperative use (surgical prophylaxis), a single dose of 1 gm administered 1/2 to 2 hours before surgery is recommended.

When treating infections caused by *Streptococcus pyogenes*, therapy should be continued for at least ten days.

No dosage adjustment is necessary for patients with impairment of renal or hepatic function, however, blood levels should be monitored in patients with severe renal impairment (e.g., dialysis patients) and in patients with both renal and hepatic dysfunctions.

HOW SUPPLIED: Rocephin (ceftriaxone sodium/Roche) is supplied as a sterile crystalline powder in glass vials and piggyback bottles. The following packages are available:

Vials containing 250 mg equivalent of ceftriaxone. Boxes of 10 (NDC 0004 1962-01).

Vials containing 500 mg equivalent of ceftriaxone. Boxes of 10 (NDC 0004 1963-01).

Vials containing 1 gm equivalent of ceftriaxone. Boxes of 10 (NDC 0004 1964-01).

Piggyback bottles containing 1 gm equivalent of ceftriaxone. Boxes of 10 (NDC 0004 1964-03).

Vials containing 2 gm equivalent of ceftriaxone. Boxes of 10 (NDC 0004 1965-01).

Piggyback bottles containing 2 gm equivalent of ceftriaxone. Boxes of 10 (NDC 0004 1965-03).

Bulk pharmacy containers, containing 10 gm equivalent of ceftriaxone. Boxes of 1 (NDC 0004 1971-01).

NOT FOR DIRECT ADMINISTRATION.

AIDS

Prevention and Control in the Laboratory and Healthcare Setting

Jerry J. Tulis, Ph.D.

Acquired immunodeficiency syndrome (AIDS) is a condition resulting from infection with the human immunodeficiency virus (HIV), formerly recognized as human T lymphotropic virus type III/lymphadenopathy-associated virus (HTLV-III/LAV). The virus belongs to a class of etiologic agents known as retroviruses, possessing RNA rather than DNA as the core genetic material. HIV attacks the T-lymphocyte, specifically the helper lymphocyte, thereby leading to a depletion of these cells and a progressive immunodeficiency state that renders the host highly susceptible to infection by opportunistic microorganisms and neoplastic disease.

Since the recognition of AIDS as a clinical entity in 1979, more than 30,000 cases have been diagnosed using criteria established by the Centers for Disease Control (CDC). Because of the latent period associated with AIDS, which may extend for many years, the clinical cases we are seeing today probably were exposed five or more years ago. In addition, by virtue of positive antibody screening procedures, about 2,000,000 individuals are believed to have been exposed. These numbers are expected to increase dramatically by the 1990s.

Risk groups have been identified: male homosexuals, parenteral drug abusers, hemophiliacs and other transfused patients, heterosexual partners of infected individuals, and children born to infected mothers. With the screening of blood, the number of people who receive infected blood and cryoprecipitates should decrease dramatically.

As the disease has begun to approach epidemic proportions, even greater interest has been stimulated in the United States and elsewhere toward the development and implementation of preventive measures and control practices. Extensive research is underway on the development of chemotherapeutic agents (e.g., AZT, Burroughs Wellcome Company, Research Triangle Park) and prophylactic vac-

cines, several of which are close to clinical trials. The massive medical program being undertaken in this country to stem this scourge is unprecedented in the annals of medical history. Concurrently, much interest has been focused on educational programs aimed at providing necessary information to young people and adults, high-risk groups, healthcare personnel, and the general public.

Transmission of the Virus

Transmission of HIV leading to infection is believed to occur primarily through the blood and semen, although the etiologic agent has been recovered from most body fluids, including saliva, tears, urine, cerebrospinal fluid, and breast-milk. Considering the classic routes of most viral infection — namely, aerogenic, by ingestion, contact, percutaneous penetration, and vectors — HIV does not appear to pose a hazard except through intimate contact (sexual relations) and mucosal and skin penetration. Thus, in a laboratory or healthcare setting, percutaneous or parenteral inoculation through accidental cuts and needlesticks, and exposure by contact of abrasions, cuts, or mucosal surfaces could be considered as potential routes of entry of HIV. Clearly, the accidental needlestick represents the most significant occupational hazard for transmission of HIV to healthcare workers. Exposure through the inhalation of aerosolized HIV has probably occurred, as documented at several reagent laboratories in 1985, but no evidence of infection was detected.

The CDC surveillance program has included 1,097 healthcare workers who had experienced parenteral or mucous-membrane exposure to blood or other body fluids of AIDS patients. Needlesticks and cuts comprise 969 (89%) of these exposures; one seroconversion (0.3%) was recorded from the 298 workers where paired sera were tested for HIV antibody. Other surveillance programs at the National Institutes of Health (NIH), involving 332 workers with percutaneous or mucous-membrane exposure, and the University of California, involving 63 workers with similar exposures, have not yielded seropositive individuals. In ad-

From the School of Public Health, University of North Carolina, Chapel Hill 27514. Presented as part of a panel discussion at the 15th Annual Alumni Conference of the University of North Carolina School of Public Health, Chapel Hill, April 1987.

dition to the above documented seroconversion, there have been five other healthcare workers without apparent risk factors for AIDS who have been infected with HIV. Of the six infected workers previously reported, four have been associated with needlestick injuries and two with extensive contact with blood or body fluids of AIDS patients. More recently (May 1987), three cases of apparent occupational infection with HIV have been reported by the CDC; these workers were exposed to HIV through skin or mucous-membrane contact with blood from AIDS patients. The exact route of entry of HIV has not been identified, although natural barriers were compromised by the presence of acne and/or dermatitis in two of the workers.

It is important to recognize that of the five reported cases of occupational infection with HIV through skin or mucous-membrane exposure, four of the healthcare workers did not use gloves or other barrier precautions. Although the magnitude of the risk to healthcare workers of skin and mucous-membrane exposure to HIV-contaminated blood is unknown, it is recognized that these exposures occur much more frequently than do accidental needlesticks. Thus, the risk of transmission of HIV from skin or mucous-membrane exposure to blood or other body fluids of AIDS patients is believed extremely rare, and considerably less of an occupational hazard than the accidental needlestick, which surveillance data indicate rarely causes HIV infections in healthcare workers.

There is no documentation of infection with HIV by ingestion, inhalation, casual contact, or vectors. Nevertheless, it is imperative that continued vigilance be exercised when handling blood specimens, tissue samples, or tissue cultures potentially containing HIV. For many years, the etiologic agents of Rocky Mountain spotted fever, rabies, and smallpox were not believed transmissible by aerogenic exposure; it is sobering now to recognize that fallacy, since all three diseases have resulted from occupational or nosocomial exposure through contaminated aerosols.

Prevention

In establishing prudent safety practices for handling HIV in an occupational setting, we have relied extensively on our past experiences over many years in the handling of hepatitis B virus (HBV), the causative agent of serum hepatitis. Although the disease associated with clinical hepatitis is considerably less serious than AIDS, especially regarding mortality, the use of HBV as a model for HIV has many merits and provides us with a conservative preventive program.

Data on the occupational infection of laboratorians and healthcare workers indicate that the risk of acquiring HBV following accidental exposure may be as high as 30-40%; information to date on HIV infection following similar exposure is indicative of a significantly lower risk, much lower than 1%. Considering that patients with acute hepatitis may possess 100,000,000 to 1,000,000,000 virus particles per

milliliter of blood and those acutely ill with AIDS only 10 to 100 virus particles per similar volume, and often fewer, one can readily understand the relative risks, even without knowledge of infectious dose.

Thus, the use of the HBV model and infectivity scenario provides us with the worst-case situation, and safety precautions and practices in use for many years in laboratories and hospitals should be ample to protect workers from occupational HIV infection. Not only is HBV more infective, but data indicate that HBV is a hardier virus in its ability to survive exposure to environmental stress or chemical disinfection. Research studies on viral disinfection have demonstrated that HIV is destroyed by alcohols, hypochlorites, hydrogen peroxide, phenolics, and formaldehyde, all readily available and extensively used laboratory disinfectants, at concentrations below those normally formulated for use. For example, with the use of sodium hypochlorite — ordinary household bleach — at a concentration of 5,000 ppm available chlorine (a tenfold dilution of household bleach), the expected log reduction calculated by using linear regression analysis is more than 1,400 logs! In addition, the more fragile ultrastructure of HIV is more amenable to disinfectant action and destruction than the more hardy HBV. The CDC recommendation for destruction of HIV in the laboratory or healthcare setting stipulates the use of the 10% solution of fresh household bleach.

The CDC/NIH guidelines entitled "Biosafety in Microbiological and Biomedical Laboratories" recommend that safety practices used for HBV should be applied to work with HIV. Consequently, biosafety level 2 is indicated for HIV based on lack of documentation that this virus is transmitted by the aerogenic route. The guidelines state that "hazards to personnel working with these agents may include autoinoculation, ingestion, and skin or mucous membrane exposure to infectious materials." In contrast, biosafety level 3 is associated with "agents where the potential for infection by aerosols is real." It seems prudent, in view of the fatal nature of the disease AIDS, that some of the safety practices employed at level 3, such as the use of biological safety cabinets, should be applied to work with HIV.

All blood and blood products being processed must be considered as potentially infective and should be handled with extreme caution. Gloves should be worn to protect the clinician or laboratorian. Hand washing is imperative; it becomes the first line of defense against the spread of virus or possible infection. The syringe and needle can become vehicles of transmission; recapping of needles, destruction of needles, or any other manipulation should be avoided. Receptacles for discard should be readily available for containment of needles and syringes. Mouth pipetting is prohibited under any circumstance; numerous devices are available as pipetting aids. Smoking, eating, drinking, and applying cosmetics are strictly prohibited practices in laboratory settings.

Finally, when applying our knowledge and experience of

HBV to HIV, an important and very significant difference becomes apparent: we have a very effective prophylactic vaccine available to protect healthcare workers against hep-

atitis B infection. To date, although under extensive research, no vaccine is available to protect individuals against AIDS. ■

A Tasteless Proposal

Caffeine Overdose

Ronald B. Mack, M.D.

An affluent society, such as ours, demands from its citizens financial contributions to organizations who attempt to find causes and cures for diseases. One disease condition, that I know of, has no such fund-raising organization, i.e. no telethons or mother's march or walkathon or mail or phone solicitation. The disease: SRT, the Scourge of the Rebellious Teenager. You will have to admit that these young people cause many cases of gray hair or no hair (from baldness due to anxiety or trichotillomania), coronary insufficiency, insomnia, peptic ulcers, onychophagia, and marital difficulties, just to name a few of the complications seen in parents and grandparents. There has never been a good way to solve this problem which has plagued us since man began to replicate himself (herself). I may have found a solution to this problem and Jonathan Swift gave me the idea (more about him later — let us save him for dessert).

Some of the ways that today's adolescents attempt to question and overturn authority is to adopt a language of their own, listen to music that most civilized adults cannot abide, dress in weird clothes, wear their hair in styles that in some periods of history would have been considered demonic and would have required burning at the stake, and, of course, indulge in practices that no parent would find rational.

One such behavior involves the remarkable increase in suicide attempts by adolescents, often using whatever drugs are already in the house or are easy to obtain from friends or on the street or even over the counter. We recently had a teenager enter our emergency room after transfer from another hospital, and he died less than 90 minutes later. Certainly a tragic end to a young life. The toxicology report revealed an abnormal level of caffeine in his blood.

If you were to ask me what is the liquid substance that keeps our country going and makes it a major force in the world, I would not say water, or blood or oil; I would say caffeine-containing liquids — coffee, tea, and soft drinks. One out of three Americans consumes an average of 200 mg of caffeine per day, in some form or another. The average American can't seem to get together in the morning

without a caffeine fix. For a fact, many contracts have a mandated coffee-break written into them. Just think of it, for most people it is a pleasure that is not illegal or immoral or fattening. At one of our nurses' stations is the following sign: "I no longer smoke. I use no salt. I haven't had an egg in years, and I hardly drink booze no more . . . I am, I swear, nearly perfect, but God — are you listening, God? — I need my coffee."

There are legends that suggest that coffee was discovered in the Ninth Century AD by Ethiopian wanderers,¹ who noticed that the cattle with whom they traveled became more active after eating coffee beans from the trees bearing this substance. These nomads decided to find out for themselves if indeed these gray-green odorless seeds could turn them on as well, and sure enough they did. Soon after, one of their smarter members, Ahmed Maxwell House, found that if you roasted the seeds and added a liquid you could produce a good tasting drink. We can only hope that these wanderers, traversing the dessert, used water as their diluent liquid.

Coffee drinking became a way of life, in a spectacular fashion, in this country after the Boston Tea Party. It has been alleged that 50% of the world's production of coffee is consumed in 98% of American homes each year.² Caffeine was initially isolated from coffee in 1821 and the rest is history.

Caffeine is ubiquitous in this country and is found in coffee, of course, and in tea, cocoa, chocolate, soft drinks, many over-the-counter drugs used as stimulants or diuretics, analgesics and appetite suppressants. Those of you old enough to remember "APCs" from World War II recall their universal usage against all pathological evils. The composition of this panacea was aspirin, phenacetin and caffeine — hence the name "APCs." We used this substance in the "sick bay" whenever there was a complaint that we could not cure by painting the diseased area with merthiolate.

Caffeine is a methyl xanthine quite similar to other xanthines such as theobromine or theophylline and is a weakly, basic alkaloid. Caffeine is quite rapidly absorbed orally, rectally (say what? Listen, nurse, if I want coffee, I drink it or not at all) and subcutaneously. After absorption, this drug rapidly diffuses in the total body water and tissues. The volume of distribution is approximately 1 liter per kilo.

From Department of Pediatrics, Bowman Gray School of Medicine, Winston-Salem 27103.

Peak serum levels are reached in approximately thirty to sixty minutes. caffeine is metabolized in the liver and excreted by the kidney, and only 10% of the drug is excreted unchanged. The half-life of caffeine is 3.5 hours except in young infants, where it is prolonged.³

Caffeine can produce many changes in the metabolism of the human body. For example, caffeine causes an increased accumulation of cyclic nucleotides through inhibition of phosphodiesterase (really? I did not know that). This reaction appears to augment the effect of some hormones, especially norepinephrine, and thus caffeine increases plasma catecholamine concentrations. Caffeine can also cause a decrease in glucose tolerance possibly due to catecholamine release, can cause induction of hepatic drug metabolizing enzymes, and is a diuretic, as most of you already are aware. It also increases the permeability of calcium in the sarcoplasmic reticulum, possibly causing the enhanced contractility of skeletal and cardiac muscle seen only too commonly with caffeine use. Caffeine blocks receptors for which adenosine is an agonist. Adenosine dilates blood vessels, slows the rate of cardiac pacemaker cells and inhibits the release of catecholamines from autonomic nerve endings.⁴ These effects may be important to recall when we begin to think about caffeine side effects and overdose.

Remember the song, "I love coffee, I love tea . . . I love the java jive and it loves me." You say you don't remember — you got no cool. In any case, the "java jive" may not like you. Caffeine is a recognized stimulant of gastric acid and pepsin production and has the ability to reduce the tone and function of the lower esophageal sphincter with resulting abdominal pain and "heartburn," feelings known to us all. Caffeine can also increase secretions from the small intestine giving rise to diarrhea. Thus it appears caffeine has the ability to exert its effects on the central nervous system, smooth and skeletal muscle, the cardiovascular system, the kidney, and the general metabolism of all users.

Caffeine exerts its effects on the central nervous system by stimulating the cerebral cortex, medullary, respiratory vasomotor and vagal centers, as well as the spinal cord. Average doses of 85-250 mg result in feelings of less fatigue, less drowsiness and more alertness. Doses of 250-500 mg can cause anxiety, restlessness, insomnia, tremors and hyperaesthesia. Doses of 500 mg can cause convulsions. The effect that caffeine has on the cardiovascular system probably depends to a large degree on dosage and is difficult to predict with any degree of accuracy. It is known that the myocardium is stimulated directly, but central vagal stimulation may overcome local effects. In very sensitive caffeine consumers, average doses may cause tachycardia, palpitations and ventricular extrasystoles. Most of the time caffeine produces vasodilation, but in moderate doses cerebral meningeal vessels constrict. Skeletal muscle has an increased capacity for muscular work following caffeine ingestion. Other effects include the diuretic, whereby moderate doses of caffeine cause an increased renal excretion of sodium and water. Doses of 3-9 mg per kg of caffeine

raise the basal metabolic rate by 10%.

Fortunately, death from caffeine overdose is rare; as you might surmise, remarkable spontaneous emesis occurs rapidly following large oral doses. The lethal dose of caffeine in an adult is between 5 and 10 grams. There is no known minimum toxic dose that is agreed upon, but one gram in an adult can produce seizures, tremors, tachycardia, vomiting, diarrhea and fever. Severe symptoms in children have occurred after an oral dose of 78 mg/kg and deaths have been reported in children after oral doses of 5.3 grams. to put these amounts in perspective, consider the following:⁵

Brewed Coffee	85-100 mg/cup
Tea	30-75 mg/cup
Soft drink	up to 54 mg/12 oz can
Cafergot	100 mg/tablet
Fiorinal	40 mg/tablet
OTC analgesics	16-32 mg/tablet
OTC cold preparations	15-30 mg/tablet
OTC stimulants	100-200 mg/tablet
Look-alike drugs	37.5-325 mg/tablet

"Look-alike" preparations, AKA "legal uppers," "pseudospeed," etc., look-a-like amphetamines, methamphetamine and other prescription stimulants. These widely used and available non-prescription products are sold as appetite suppressants and stimulants and usually contain caffeine, phenylpropanolamine and ephedrine. Most of these preparations are made to look like prescription dose units of amphetamines. The FDA, in November 1983, communicating via the Federal Register, mandated that caffeine, phenylpropanolamine and ephedrine or combinations of any two of these will no longer be allowed on the market. However, illegal combinations can still be found on the "street." Recently, five deaths due to caffeine in "look-alike" drugs were reported.⁶

With the background information, it should be relatively easy to predict the clinical course of patients who overdose on caffeine, either accidentally or on purpose. It is no surprise that gastrointestinal symptoms are the earliest adversities to present; they consist of abdominal cramps, world-class nausea and vomiting (can be hemorrhagic) and diarrhea. It is stated by many authorities that central nervous system signs and symptoms are the most common and most consistent and begin often as agitation and restlessness before proceeding to tonic posturing, fever, rigidity, fluctuating levels of coma and convulsions. The cardiovascular effects of caffeine overdose are much to be feared and may well be the cause of death in such cases. Sinus tachycardia, PVC's, bigeminy, paroxysmal atrial tachycardia and cardiovascular collapse can occur. Systemic hypertension has also been reported. Pupils are most often miotic but may be dilated. A recent article reports acute psychosis occurring in an adolescent patient with anorexia nervosa who ingested mega quantities of caffeine.⁷

Laboratory findings in caffeine overdose include hyperglycemia, glycosuria, ketonuria, hypokalemia and periph-

301-964-2811

eral leucocytosis. It is possible to obtain plasma caffeine levels, which reach a peak within two hours of ingestion. Irritability and tonic posturing have occurred with levels of 1.7 mg/dl, tachycardia and convulsions have occurred with levels of 4.6 mg/dl, coma and opisthotonus with 12.5 mg/dl and death with levels greater than 15 mg/dl six hours after ingestion.³ Our patient died 20 hours after ingesting caffeine with a caffeine level of 1.1 mg%; we have no idea what was earlier in the course and no other drugs were found in the toxicology samples. You cannot use caffeine levels anyway, as the toxic or lethal levels vary so widely in the literature as to be of no clinical use in management except for qualitative identification of the drug.

Treatment

The treatment is supportive, as there is no antidote or antagonist. Gastric emptying, charcoal and cathartic administration appear to be indicated. Seizures can be treated with intravenous diazepam or phenytoin or phenobarbital if diazepam fails. Giving liquid antacids may reduce the gastric

irritation. The cardiac arrhythmias that ensue can be treated with an appropriate agent dependent on the type and severity of the disturbance. Monitor fluid and electrolyte balance, urinary output and cardiopulmonary status. Most cases of caffeine overdose do not result in death.

Realizing that many of our young people have annoying and disgusting mannerisms and habits, we might copy a plan proposed by Jonathan Swift in 1729. Our man Swift was an Episcopalian clergyman in Ireland who is acclaimed for his marvelous satirical writings. He is best known for his classic tale, *Gulliver's Travels*. What to many children is a grand adventure story is really an attempt by the author to satirize the pettiness of human nature in general and the government in power in particular. Swift entered politics to represent the Irish church in petitioning the English Queen and government to provide funds for the church. He was turned down and decided to seek revenge in the only way he knew how; using his accomplished literary skills. He also wrote an essay which is considered a classic among lovers of English literature; it is called *A Modest Proposal*⁸ — subtitled "For Preventing the Children of Poor People in Ireland From Being a Burden To Their Parents or Country And for Making Them Beneficial To The Public." In this outrageous tract, he proposed a plan to raise and market Irish babies for food. This was his way of satirizing the failure of the English government to provide the necessary funds for the Irish poor. It is considered the most savage of his writings; I mean the man was angry but also very clever. Now, what do you think? Should we harvest our incorrigible teenagers and put them to good use? Raise them for food for local consumption and export? (It would probably help our ailing balance of trade.) By the way, I won't be eating any, thank you. I've heard they taste terrible in pasta. ■

Controlled Substances from the Emergency Room

Edited by Eugene W. Linfors, M.D.

How should physicians respond to patients who hop from Emergency Room to Emergency Room for the purpose of obtaining controlled substances? How can these patients be identified? Should knowledge of this drug-seeking behavior be made available to other Emergency Rooms in the area?

From E. Jackson Allison, Jr., M.D., M.P.H., Chairman, Department of Emergency Medicine, East Carolina University, Greenville.

Our group of academic emergency physicians at the Department of Emergency Medicine, East Carolina University School of Medicine/Pitt County Memorial Hospital in Greenville, have collectively developed a high index of suspicion when confronted by patients who are seeking narcotic medications. Quite honestly, we have also been fooled at least twice in the past seven years, and these experiences have helped to remind us not to repeat similar mistakes in the future.

It is always helpful to request old records when we suspect drug-seeking behavior. Many times these records will contain shocking revelations, such as those about an ECU professor who had received an unbelievable number of dosages of narcotics over a ten-year period: it literally took three volumes of charts from Medical Records to document the total spectrum of abuse. Once we had fully identified the problem, we took the following steps: the patient was not allowed to receive any further narcotic agents in the Emergency Department unless the patient was being admitted to hospital; a discreet memo was circulated to all concerned parties, notifying them of the extent of this patient's involvement; the State Bureau of Investigation (SBI) was alerted.

We have a system of notifying other Emergency Departments in our region of patients who present who are

obviously seeking narcotic medications. Again, this mutual cooperation amongst colleagues over the past few years has been very gratifying.

We always notify the SBI of patients who exhibit suspicious behavior in our Emergency Department. The particular SBI agent in Greenville who deals with these cases has been exceptionally helpful and professional.

We have three forms of internal communication within the Emergency Department to make sure that the physicians and nurses are aware of patients who attempt to abuse our Emergency Department in this realm: we have a communications book at the nurses' station, in which we make appropriate notations about these patients; the physicians also have a confidential communications book they keep locked up for more in-depth information whenever the SBI and/or other Emergency Departments become involved; and the nurses have a similar book. We also make appropriate notices for the registered nurses who serve as our triage officers on a rotating basis in the Emergency Department.

In summary, these patients need to be dealt with appropriately, yet firmly; the proper authorities such as the SBI need to be notified early, as well as our colleagues in surrounding Emergency Departments; communications is the key to halting drug-seeking behavior.

From Frederick W. Glass, M.D., Head, Section of Emergency Medicine, The Bowman Gray School of Medicine, Winston-Salem.

For those who work in the Emergency Department and for all other physicians who handle patients on an out-patient

From 306 Gregson St., Durham 27701.

basis, it is difficult to recognize the professional drug abuser. There are a few obvious signs which would include puncture wounds of the extremities, peculiar behavior or the fact that they are allergic to certain, specific narcotics which you would like to prescribe. The most common complaints include the kidney stone, headache, and those with abdominal pain.

I have adopted the almost rigid policy of dispensing no narcotics except one or two tablets of Demerol or Dilaudid on an out-patient basis. My universal pain medication includes Codeine if I think the patient is in pain, and if the pain is more severe than Codeine will take care of I strongly suggest hospitalization and a work-up. This discourages many of the professional abusers but there are a few still who get into the system by being willing to accept any of these procedures. Although these people are difficult to identify at times, we do have a mechanism in this city between two major Emergency Departments of notifying each other when we think we have seen such patients.

I am uneasy with this working philosophy, realizing that there are many patients who will continue to have pain, but I believe that the consequences of controlling the substance are as important as having the patient come back to the Emergency Department for further work-up.

From Noel B. McDevitt, M.D., a plastic surgeon in Pinehurst.

As a plastic surgeon, I see very few patients for whom prescribing of controlled substances might be questionable. Identification of such individuals can be difficult, particularly when there has been an antecedent history of injury or illness which might have, as an associated problem, chronic pain.

Generally when there is a question regarding this, a psychiatric consultation is in order; and frequently, particularly for suspected chronic pain syndromes, referral to a pain clinic is suggested. The patient who resists such referrals might be suspected as one who is the "hopping patient."

The question of sharing the identification of individuals who are hopping from Emergency Room to Emergency Room involves patient confidentiality, unfortunately; and while desirable, could leave the physician and/or institution open to action from an individual thus identified. Legislation allowing such identification would be desirable, but careful safeguards would need to be included to prevent abuse and improper identification of such individuals.

From Ronald B. Mack, M.D., Chairman, Committee on Drug Abuse and Pharmacy, NC Medical Society.

I believe that we need a 24-hour-a-day, 7-days-a-week,

central repository, computerized, with easy access by modern or other electronic gear, to provide information on habitual emergency room "shoppers" for controlled substances.

I also believe physicians need legal immunity, as we do in child abuse cases, so that we may report suspicious potential drug-abusing behavior with impunity.

Emergency rooms in the same general area should be allowed to share information regarding drug-seeking persons even if it requires a state statute.

From Daniel G. Sayers, M.D., Section of Emergency Medicine, The Bowman Gray School of Medicine, Winston-Salem.

The conscientious physician must not let considerations such as the identification of drug seekers prevent the judicious use of pain relieving agents in the emergency setting. The relief of pain remains one of the most important foundations of medical practice. I believe it is clearly better to give a narcotic to an habitual user than to refuse a person who is in agonizing pain. Physicians are not and should not be police, in my opinion.

On the other hand, it is appropriate to withhold controlled substances where pain medication can confuse physical findings and interfere with the ordinary course of diseases which rely on pain patterns for their accurate diagnosis. Additionally, physicians would not knowingly aid and abet the habitual user of controlled substances except in cases where it is necessary to interrupt a severe withdrawal reaction which may be dangerous. The act of withholding controlled substances may be quite within ethical limits in the appropriate circumstance.

With these background statements in mind, I feel that it is quite important to identify drug-seeking in emergency departments as well as in physicians' offices. Physicians' offices tend to be less accessible and less impersonal than emergency departments, and it is more difficult to see a new physician on each visit in the office setting.

The emergency department, with shift physicians who sometimes travel long distances to work relatively infrequent shifts, and with immediate and unquestioning access 24 hours per day, is more vulnerable and is quite easily found by the traveling drug user.

In my experience, identification of the traveling substance abuser can be quite easy in the setting of a patient who requests drugs without the stigmata of severe pain or who approaches the physician in a seductive, dependent or demanding manner. Often there are vague or unprofessional notes from alleged physicians in different states or in some cases discharge summaries from large institutions such as teaching hospitals. Most times, the physician is unreachable on the telephone or if called, will describe obscure diagnoses, early departure from the hospital or poor follow-up.

Patients may exploit real diseases or physical findings and sometimes go from emergency department to emergency department with complaints of severe pain relating to these. Another red flag may be multiple allergies which prevent studies from being performed or which make the use of medium strength pain medications impossible. In some cases, old charts from the institution will be of help in showing a somewhat inappropriate pattern in seeking emergency department care to the exclusion of scheduled follow-up visits.

The problem for the somewhat isolated emergency department physician is to establish the repetitive or exploitative pattern. Communication patterns among emergency departments are poor because they are cumbersome and because emergency department physicians tend not to know one another well. There exists no central repository for information, and legal considerations have prevented us from reporting patients by name on a mere supposition unless the evidence is quite strong. Occasionally, local hospitals or regional systems can notify one another, but no regular procedure or predictable patterns have been established to my knowledge. The occasional message from one hospital to another will allow an exploiter to be confronted and rarely this will interrupt that person's pattern. We have no method of enforcement, however, unless it can be demonstrated that fraud has been perpetrated by the use of false names, misuse of insurance or clear misrepresentation. The result is that in most cases, the inappropriate drug seeker will simply be discharged to try again somewhere else if he or she so chooses. It is interesting to me that the people I have identified as drug seekers in the past often are quite hostile and threatening when denied pain relief. I think in most cases that this must have been at least partially successful for them in obtaining drugs or they would not display this type of behavior, which clearly alienates the health care provider.

I would like very much to see or to stimulate discussion about a central repository where information could be deposited and easily accessed regarding the inappropriate use of the emergency department, particularly in the case of drug seeking. I believe that the North Carolina Hospital Association has cooperated in publishing descriptions of "professional patients," but these documents have been of little help to me because they are oftentimes out of date. Something like this system needs to be initiated using electronic communication technology. To date, the problems of confidentiality and the potential for false accusation have largely prevented a public dialogue about how to implement such a program. We have addressed this issue in the North Carolina Medical Society's Committee on Alcohol and Drug Abuse, and personnel from the State Bureau of Investigation have expressed interest in developing systems by which abusers might possibly be identified.

I feel sure that the majority of emergency physicians would be quite enthusiastic about a method by which an individual physician could discover whether or not a patient who appeared suspicious had displayed similar behavior at other institutions. In the Winston-Salem/Greensboro region,

the cooperative efforts of the State Bureau of Investigation and emergency physicians have in at least one case resulted in the apprehension of a patient with known carcinoma of the lung who sought Dilaudid in six separate emergency departments in one 24-hour period. I feel that this type of cooperative effort is quite appropriate and that it benefits both the medical profession and the citizens of North Carolina. I think that physicians need to have some assistance in the identification of this type of psychopathology in order that public services might be notified to initiate investigation and possibly treatment programs. I believe that in this situation, the physician has a similar responsibility to that which obtains when a case of child abuse is identified. We simply do not know the scope of the problem nor its ramifications. In order to describe the epidemiology of this problem, we must have a safe and effective method which will enable us to learn the true incidence.

**From Harold R. Silberman, M.D.,
Medical Director, Emergency
Department, Duke University
Medical Center.**

There are numerous excesses in the use of emergency rooms these days and certainly high on any list of inappropriate visits are those made by individuals who come solely to seek analgesics. This is no surprise since a particular segment of our society, which harbors many with drug habits, uses ERs almost exclusively for all of their medical, surgical and psychological needs.

Unfortunately, the type of behavior under discussion, which includes hopping from emergency room to emergency room for the sole purpose of obtaining controlled substances, can receive too much emphasis or the wrong type of attention. Nurses, doctors, and even secretaries, frustrated by certain aspects of emergency medicine, frequently get caught up in the fun of catching these folks. This game of "gotcha" may be temporarily satisfying, but certainly isn't a productive effort for an emergency department.

Identifying the so-called "drug seeker" is still an imperfect and sometimes expensive process. Needletracks are the most blatant clue. Nurses, especially during the triage function, pick up on certain characteristic mannerisms including evasive answers to questions, eye avoidance, and a composure inappropriate for the reported severity of pain. All of that, along with a claimed "sixth sense," suggests that the patient doesn't have a legitimate complaint. Sometimes a member of the staff actually recognizes a repeating offender. In many instances, it's necessary to spend some money on laboratory studies, x-rays or even scans in order to rule out possible causes for pain such as renal stone, fracture, pneumonia or even an intracranial process. Missing certain diagnoses in an addict could be just as expensive during and after litigation as it would be if drug misuse were not at issue.

In the Duke Hospital Emergency Department we keep a card file of those people identified as coming solely for narcotics, and some of them have several aliases. However, it requires that a nurse or doctor be suspicious enough to look in that file for assistance when evaluating a patient's symptom.

Although a very pertinent point of law could be raised concerning the legality of sharing information without an individual's expressed consent, it has seemed morally and ethically appropriate for ERs to warn one another about drug seekers under the rubric of reducing direct injury by restricting access to harmful substances, or preventing an indirect injury such as trauma to pedestrians or operators caused by an impaired driver. Even though this kind of spreading the word has become commonplace and could be called the standard of practice, that alone might not protect one against a theoretical suit based on breach of confidentiality. This area certainly needs more thought and discussion.

There is a constant obligation for physicians to inform and teach in all areas of patient contact regardless of the arena or the medical setting. It is appropriate and important to inform each person known to be abusing himself or herself with substances, that: (1) you, as the doctor for this current encounter, are aware of their unhealthy behavior; (2) they need to seek treatment for drug dependency; (3) you've made an entry into their chart about the problem; (4) some emergency room staff share this kind of information with one another; and (5) it is a criminal offense to withhold information about the recent use of analgesics while trying to obtain something for pain from a new doctor (called "doctor shopping" by narcotics officers and SBI agents).*

America's problems with illicit drugs are manifold and extensive. A small portion of a very complex situation is played out in emergency rooms. ER doctors should certainly participate in some way towards the control of this tragedy without being naive about their expectations and without expending energies that are better used in their primary goal, the recognition and urgent management of severe medical or surgical crises. Part of the essence of emergency medicine is learning how to prioritize. I clearly put catching drug addicts low on my list of priorities even though it can sometimes be good sport!

*Statute North Carolina GS. 90-108 (A) (13)

"To obtain controlled substances through the use of legal prescriptions which have been obtained by the knowing and willful misrepresentation to or by the intentional withholding of information from one or more practitioners."

"Any person who violates this section shall be guilty of a misdemeanor. Provided, that if the criminal pleading alleges that the violation was committed intentionally, and upon trial it is specifically found that the violation was committed intentionally, such violations shall be a class I felony."

From Anthony J. Weisenberger, M.D. and Alan L. Krueger, M.D., practicing psychiatrists at Appalachian Hall, Asheville.

We have discussed this issue and also elicited the opinions of several other staff members. The following are our thoughts:

MDs should become more aware of techniques of addicted individuals and should come to understand "drug-seeking" behaviors.

Physicians should medicate more for *signs* rather than *symptoms*.

With computerization, MDs should be able to establish patterns of ER utilization within their own facility. This information would be valuable in determining the drug-seeking behaviors.

As to legislation/controls, it is our understanding that we have a "doctor shopping" law in the state. This should be utilized. When and if a person is suspected of obtaining drugs from various MDs/ERs, they should be reported to the SBI's Drug Diversion Unit (Keith Bulla — 919/292-5320) for an investigation.

Again, we need to recognize that the majority of problems are known to MD/ER personnel, but they do not confront.

From Charles S. Betts, M.D., a physician in Asheboro.

These patients need to be identified by some central tracking mechanism, for they are addicts in the true sense of the word, using every bit of manipulative behavior that they have at their disposal in order to sustain their habits. Usually these patients can be identified by realization of the fact that they often ask for specific drugs for their problems, usually Dilaudid or Demerol. Often if patients come into the emergency room requesting specific medication this will alert the emergency room physician to a potential drug problem. Unless these addicts are identified and placed into a treatment program, they will continue to be a menace to an already busy emergency room population.

The knowledge of this drug-seeking behavior in these various patients should be made available to other emergency rooms in the area. It is through central tracking and distribution of such information that these patients stand the best chance of getting help.

It is important to keep in mind that these patients who exhibit such drug seeking behavior do not have the choice of foregoing drugs. It is a common misconception that either with will power or by simply saying no they can stop of their own free will. By the time these patients hop from emergency room to emergency room they have lost all control of their addiction, exhibiting a compulsive and obsessive type of behavior over which they have no control; they are

essentially powerless over their addiction and unable to manage their own lives.

Having been through such a dilemma myself as these unfortunate patients present with, I can appreciate the fact that, unless these patients are stopped and channeled into some meaningful drug rehabilitation program, they will continue to abuse the system as long as they have the means to get from emergency room to emergency room.

From Stuart Todd, M.D., General and Vascular Surgery, Boice-Willis Clinic, Rocky Mount.

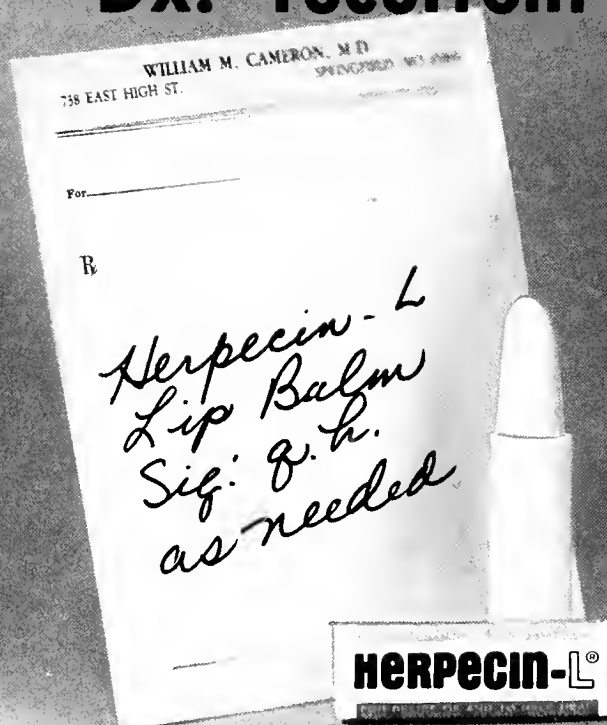

The question of patients who go from Emergency Room to Emergency Room for the purpose of obtaining narcotics is not something I deal with a great amount. We have Emergency Room physicians who see most of that, although I do have an occasional patient with whom that is a problem. Here in Rocky Mount, we have tried to make other phy-

sicians aware of these patients and I do not know that there is a standing list of these patients. It seems that once a person is identified as a drug abuser and Emergency Room abuser, it would be reasonable to have a list of these patients posted in the Emergency Room; or if doctors in their offices are aware of patients who are chronic pain abusers, they should make the Emergency Room aware of this problem. As to whether or not it should be made available to other Emergency Rooms in the area, I think certainly that seems reasonable to do.

As a surgeon, I treat a lot of patients with chronic pain, and because of the type of practice I have, several of these people have become narcotic addicts, and the family and patients recognize the problem. Usually, I deal with the pharmacist and we have worked out an understanding about this kind of problem. I have seen very few people who are actually pain medicine abusers. ■

Editor's note: I guess the same question could be asked about people who visit doctors' offices looking for specific drugs.

A WEIGHT LOSS PROGRAM IN MY PRACTICE?

Admit it. You don't have a great track record for helping patients lose weight.

For more information, call or write:
David Consolvo, M.D., Clinical Director or
Jennifer Breslin, V.P. for Business

How would you like to implement a ready-made, well-organized weight-loss program in your office? A program which is both medically responsible and financially responsible?

Weight control is so often needed to help control or prevent patients' medical problems. With our "Take Charge" Program, we can provide you with all the tools required, such as printed educational material on a large number of topics; food-record booklets; motivational progress charts on weight, per cent body fat, and girth measurements; portion-controlled foods; and more. We also have available an excellent personality profile developed by Taibi Kahler, PhD, to individualize your program approach and give insight to your patients. And we will train you and a staff member to administer the program.

Our program has been successful nationwide for more than four years, with thousands of successful dieters. It has previously been available only as a franchise to independent entrepreneurs, for thousands of dollars. Now with some adjustments to our marketing and clinical techniques, we are making the program available to physicians on a licensing basis and offering you an exclusive territory. We are looking for four physicians in North Carolina to join our national pilot program, with NO license fee. You are already paying the rent, electricity, and phone. Without raising this overhead, let us show you how to increase your bottom line.

JenDale, Inc., P. O. Box 5604, Charlottesville, Va
22905. (800) 446-6003.

Now America's oldest professional liability insurer has come to North Carolina.

The newest professional liability insurer in North Carolina is the oldest in the nation. The Medical Protective Company pioneered the concept of professional protection before the turn of the century and has been serving doctors exclusively ever since. Through good times and bad.

With the current liability crisis escalating, you need to take a close look at your coverage and the company that stands behind it. Then take a close look at us. You'll see we carry the highest

rating from A.M. Best, the firm that tracks the financial stability of insurance companies nationwide. Beyond that, you'll find complete protection at premium rates that are likely lower than you're currently paying. Plus the personal attention and claims prevention assistance you deserve.

Contact Stu Mitchelson today at 704/541-8020. He's the oldest company's representative in its newest state. And he's here to serve you.

CORTISPORIN® OTIC SUSPENSION/SOLUTION* (Sterile) (polymyxin B-neomycin-hydrocortisone)

Burroughs Wellcome Co.
Research Triangle Park
North Carolina 27709

CORTISPORIN® OTIC Suspension Sterile (Polymyxin B-Neomycin-Hydrocortisone) Description: Each cc contains: Aerosporin® (Polymyxin B Sulfate) 10,000 units. Neomycin sulfate (equivalent to 3.5 mg neomycin base) 5 mg. Hydrocortisone 10 mg (1%). The vehicle contains the inactive ingredients cetyl alcohol, propylene glycol, polysorbate 80, water for injection and thimerosal (preservative) 0.01%. Indications: For the treatment of superficial bacterial infections of the external auditory canal caused by organisms susceptible to the action of the antibiotics, and for the treatment of infections of mastoidectomy and fenestration cavities caused by organisms susceptible to the antibiotics. Precautions: This drug should be used with care in cases of perforated eardrum and in long-standing cases of chronic otitis media because of the possibility of ototoxicity caused by neomycin. **CORTISPORIN® OTIC Solution Sterile (Polymyxin B-Neomycin-Hydrocortisone)** Description: Each cc contains: Aerosporin® (Polymyxin B Sulfate) 10,000 units. Neomycin sulfate (equivalent to 3.5 mg neomycin base) 5 mg. Hydrocortisone 10 mg (1%). The vehicle contains the inactive ingredients cupric sulfate, glycerin, hydrochloric acid, propylene glycol, water for injection and potassium metabisulfite (preservative) 0.1%. Indications: For the treatment of superficial bacterial infections of the external auditory canal caused by organisms susceptible to the action of the antibiotics. Warning: Contains potassium metabisulfite, a sulfite that may cause allergic-type reactions (e.g., hives, itching, wheezing, anaphylaxis) in certain susceptible persons. Although the overall prevalence of sulfite sensitivity in the general population is probably low, it is seen more frequently in asthmatics or in atopic nonasthmatic persons. Precautions: This drug should be used with care when the integrity of the tympanic membrane is in question because of the possibility of ototoxicity caused by neomycin. Adverse Reactions: Stinging and burning have been reported when this drug has gained access to the middle ear. Contraindications, Warnings, Precautions and Adverse

Reactions Common to Both Products. Contraindications: These products are contraindicated in those individuals who have shown hypersensitivity to any of the components, and in herpes simplex, vaccinia and varicella. Warnings: As with other antibiotic preparations, prolonged treatment may result in overgrowth of nonsusceptible organisms and fungi. If the infection is not improved after one week, cultures and susceptibility tests should be repeated to verify the identity of the organism and to determine whether therapy should be changed. When using neomycin-containing products to control secondary infection in the chronic dermatoses, such as chronic otitis externa, it should be borne in mind that the skin in these conditions is more liable than is normal skin to become sensitized to many substances, including neomycin. The manifestation of sensitization to neomycin is usually a low grade reddening with swelling, dry scaling and itching; it may be manifest simply as a failure to heal. During long-term use of neomycin-containing products, periodic examination for such signs is advisable and the patient should be told to discontinue the product if they are observed. These symptoms regress quickly on withdrawing the medication. Neomycin-containing applications should be avoided for that patient thereafter. Precautions: If sensitization or irritation occurs, medication should be discontinued promptly. Patients who prefer to warm the medication before using should be cautioned against heating the solution above body temperature, in order to avoid loss of potency. Treatment should not be continued for longer than ten days. Allergic cross-reactions may occur which could prevent the use of any or all the following antibiotics for the treatment of future infections: kanamycin, paromomycin, streptomycin, and possibly gentamicin. Adverse Reactions: Neomycin is a not uncommon cutaneous sensitizer. There are articles in the current literature that indicate an increase in the prevalence of persons sensitive to neomycin.

*Caution: If perforation of the eardrum exists, specify Cortisporin Otic Suspension (this drug should be used with care in cases of perforated eardrum).

The Story of Interferon

LINVILLE M. MEADOWS, M.D., HOWARD OZER, M.D., PH.D.,
and RUSSELL E. KAUFMAN, M.D.

There are a number of interesting stories in medicine. Some demonstrate the latest advances in medical technology. Some reflect the personalities involved, others the manner in which the pendulum of scientific opinion swings back and forth. So it is with the story of interferon, which begins 30 years ago.

Interferon was discovered in 1957 by Dr. Alick Isaacs, who was working with an American graduate student named Jean Lindemann in his laboratory in Mars Hill, England. They were studying influenza virus using amniotic membranes from chicken eggs. They isolated the membranes from fertilized eggs and cultured them in a laboratory dish. When influenza virus was added to the dishes, it would attack the cells in the membranes and kill them. They discovered that if they first killed the virus by heating it, so that it could no longer infect the cells, the cells would then become resistant to a later challenge by live virus. Somehow, exposure to the killed virus allowed the cells to resist infection. When they added the culture fluid from the treated cells to untreated cells, the untreated cells also became resistant to infection with influenza. Exposing the chick cells to killed virus

caused the cells to produce a protein which could interfere with the viral infection. They called the protein interferon.

Over the next few years, other investigators confirmed the findings of Isaacs and Lindemann, but because interferon was produced in such minute quantities it was impossible to obtain enough to analyze it biochemically using the techniques then available. Workers in the field came to be thought of as phenomenologists and practitioners of fringe science. Isaacs came to be described as "a serious virologist who'd become a crackpot." Interferon, difficult to study and impossible to purify, became known as "imaginon."

The First Look at Cancer and Interferon

The first evidence that interferon might be an anti-cancer agent came in 1968 from the work of Dr. Ian Glasser. It was known that a number of tumors in mice could be induced by certain viruses, known as retroviruses. He reasoned that if interferon blocked viral infection then it might also prevent the development of the tumors they caused. He injected large doses of interferon into the animals and indeed blocked the formation of the virally-induced tumors. As a control, he injected the mice with transplantable tumors which were not virally induced, but to his surprise, when he treated the mice with interferon, the growth of these tumors was slowed as well. Thus

From Department of Medicine, Division of Hematology/Oncology, Duke University Medical Center, Durham 27710; and Department of Medicine, Division of Medical Oncology, University of North Carolina at Chapel Hill 27514.

interferon was capable of inhibiting the growth of tumors in a manner independent of its anti-viral activity.

Glasser's findings were not considered significant at the time for several reasons. First, a number of substances had been found to inhibit tumor growth in the laboratory, but rarely could such studies be translated into therapy for humans. Second, since a human weighs approximately 350 times as much as a mouse, the quantities of interferon required to treat even one patient would be astronomical.

The problem of producing interferon in quantity was first successfully addressed by Dr. Kari Cantell, working at the Public Health laboratories in Helsinki, Finland. He isolated leukocytes from outdated units of blood, then stimulated them with killed Sendai virus, which caused the leukocytes to make interferon. Literally hundreds of units of blood were required, but by painstaking and laborious efforts he worked out a purification scheme for interferon. The product was still impure by today's standards, and was incredibly expensive, but for the first time, enough interferon was available for clinical studies.

The first human trials were done by Dr. Hans Strander of the Karolinska Institute in Stockholm. He used Cantell's leukocyte interferon to treat patients with a rare bone tumor known as osteogenic sarcoma; research had suggested that this tumor might be related to a viral infection, so it was reasonable to assume that it might be sensitive to interferon. Strander's results suggested that interferon was effective in treating these patients, but he made the classic mistake in clinical oncology — he compared his patients to historical controls, that is, he compared patients treated with interferon to patients who had been treated in the past. By doing this, he ignored advances in medicine that probably also contributed to his patients' survival. Later studies were not able to confirm Strander's results, but the cat was out of the bag. By July 1973, interferon was being touted as a cancer breakthrough on the editorial page of the *New York Times*.

The prevailing climate of scientific thought began to change. In 1975 the first international conference on interferon was held in Washington, D.C. For the first time clinicians, immunologists, virologists, and oncologists were assembled to discuss the possible anti-tumor uses of interferon. Interferon was a topic fit for serious discussion; it had achieved scientific respectability.

Slowly, pressure began to mount on the National Cancer Institute to undertake human trials with interferon in the United States, in spite of its tremendous cost. Florida Congressman Claude Pepper lobbied for such trials on the floor of the U.S. House of Representatives. M.D. Anderson Hospital received a \$1 million grant from the Mary Lasker Foundation to buy interferon from Cantell. The American Cancer Society (ACS) also agreed in 1978 to underwrite \$2 million to study interferon. The ACS decision to purchase interferon led to an avalanche of publicity; it was the largest amount of money ever com-

mitted by the ACS to a single project. Interferon made the cover of *Time Magazine*.

Cloning Interferon

At this point the story of interferon takes another turn, for it was in 1979 that Dr. Tadatsugu Taniguchi, working at the Japanese Cancer Research Institute, announced the molecular cloning of the first interferon gene. It had become increasingly obvious that the powerful tools of molecular biology — the use of recombinant DNA technology to mass-produce biological products — were going to be put to commercial use. New molecular biology companies, the genetic "boutiques," sprang up overnight: Cetus and Genetech in California, Biogen in Switzerland and Cambridge. Some of the larger drug companies such as Hoffman-LaRoche bought these smaller companies outright, or forged alliances with them; others, such as Searle, developed their own programs. To demonstrate the effectiveness of recombinant DNA technology, they chose a biologic product that was prohibitively expensive to produce by natural means: the choice was interferon. The publicity associated with the ACS decision to spend \$2 million on interferon probably contributed significantly to the decision by these new companies to make interferon their showcase project. The only major company to abstain from the race was Eli Lilly, which focused its efforts on protecting its \$100 million-a-year insulin market by developing Humulin, their recombinant human insulin.

So, how does one go about "cloning" a gene? The central dogma of modern genetics is that the information coded in the cell's DNA, housed in the nucleus, is transcribed into messenger RNA, which is then translated into protein on ribosomes in the cell cytoplasm. The gene of interest may exist in only one or a few copies and be hard to find, but if a cell is producing a lot of the protein, then the messenger RNA will exist in many copies. The messenger RNA can be isolated, and injected into frog eggs which will unwittingly translate it into protein, so it can be detected as interferon. Using this assay, the messenger RNA can eventually be isolated in pure form. Next, an enzyme known as reverse transcriptase is used to copy the RNA back into DNA; If this is done in the presence of radioactive nucleotides, which the enzyme uses as building blocks to assemble the DNA, this copied DNA, also known as cDNA, can be used as a probe to "find" the DNA which originally produced the messenger RNA.

DNA exists as a double-stranded molecule, and when heated, the strands separate, but retain their primary structure. Strands of DNA or RNA which contain complementary information, and thus a complementary structure, will hybridize or bind to each other with a high degree of specificity. This binding is the key to isolating

Submitting Electronic Medical Claims

RONALD J. MEYER

A new way to submit claims electronically is now available to physicians in North Carolina. Technology has been developed which enables medical office systems to routinely dial a telecommunications network and submit claims to over thirty carriers, including The Prudential Insurance Co. (Medicare 'B'claims), and to the National Electronic Information Corporation (NEIC) for commercial carrier and Railroad Retirement Claims.

The claims clearinghouse network is available by a local call from 25 cities in North Carolina and a total of 650 cities nationwide. There is a toll-free number for practices outside the local dial areas.

Designated the EMC*EXPRESS™ System, the service has been introduced successfully in Illinois, California, Pennsylvania and eight other states. The service is being marketed through vendors of physician and hospital computer and software systems. The Company and the vendor select and tailor appropriate communications technologies. These vendors then aid medical offices in switching from paper claims to paperless claims systems.

In place, the system works something like this:

A typical subscriber might be a physician with a microcomputer and a practice management software package. During the day, the system is used to maintain patient records, prepare financial reports and provide word processing capability. As patient claims are prepared on the computer, they are stored for batch transmission that night. At the appropriate time the computer dials the local telephone number of the teleprocessing network and transmits the claims accumulated during the practice day.

Claims are sorted by a central computer and stored in "mailboxes" to await a phone call from the designated

insurance carrier. Carriers call after 3:00 a.m. each day and extract the claims. Thus, claims can be in the carrier's computer within 24 hours of the patient visit. Error reports are returned electronically by some carriers.

Some vendors also offer microcomputers which function strictly as claims entry workstations.

The Benefits to Physicians

Faster turnaround of claims. Mail delays and claims entry work are eliminated at the carrier site, so a significant number of days are cut from the process.

Lower error rates. Computer systems are capable of checking for designated errors and omissions before the claim is sent, and they normally reduce or eliminate the need to manually re-enter data — the process that is most susceptible to human error.

The network supports a wide variety of devices and protocols from either the provider side or the carrier side. This means that subscribers to the clearinghouse generally can continue to use existing computer equipment and avoid the need to invest in new equipment.

In effect, the network is acting as a single pipeline to the primary carriers accepting batches of claims from a number of health care providers and preparing them for pickup by insurance carriers.

As a result, it is generally possible for physicians and billing services to access the network and to submit claims in one format to the local Medicare Part B carrier, Medicaid, Railroad Retirement, and to processors of group health claims, including Blue Shield. ■

A Picture Is Worth A Thousand Words? Not Always...

Some Plain Talk on Physician Dispensing

Q. What is Physician Dispensing?

A. It is the resurgence of a time honored service that once included all doctors. It is that service that can save your patients' time and allow you to conveniently dispense the prescriptions you write in your own office. In short Physician Dispensing combines income enhancement with increased patient convenience.

Q. How do I really know my patients will like this service?

A. Extensive surveys and the experience of thousands of doctors have shown that many patients prefer the convenience of purchasing their medications directly from their physicians. With our recommended prices, your patients will usually SAVE money and time.

Q. Is Physician Dispensing ethical?

A. Yes, just as other physician's services — lab, x-ray, diagnostic procedure. Physician Dispensing is ethical since patients have the choice to drive to the pharmacy or let you fill their prescriptions.

Q. Will dispensing affect my insurance?

A. In the view of most insurers, you are already dispensing when you give sample drugs to the patient or administer injections, so dispensing represents no change.

Q. How much staff time is involved in dispensing and is there much extra paperwork?

A. Our computerized labeling and record keeping system is very efficient. *All needed reports are automatically*

generated. It only takes about 60 seconds to dispense a prescription ... frequently less time than calling back and forth to the drug store.

Q. May I try the system in my office without obligation?

A. You can order a 30 day supply and get acquainted with the system. We will come in and help you get started. If you should find that dispensing is just "not for my practice", *You may return any unused medication within 30 days, without any further obligation.*

Q. Why should I choose CompuMed as my dispensing system?

A. CompuMed's System has been designed to meet the individual Physician's specific needs...designed after thousands of hours of hands on experience actually helping physicians dispense in their practices...designed from the inside of the physician's office up — not from the warehouse or the board room down:

- We Can Provide Any of Over 13,000 Medications.
- Including All Brand Names.
- Full Line of Bioequivalent Generics.
- Custom Packaged in the Exact Size You Prefer.
- Packaging Meets or Exceeds FDA & DEA Requirements.
- Your Choice of Computerized or Manual Dispensing Systems.
- Local Service Representatives.

Q. Is an investment required to get started?

A. Nothing, CompuMed can structure terms so no cash investment is needed.

We're Here For You, North Carolina

Medical Mutual Insurance Company was created by North Carolina physicians in 1975 to stabilize the volatile professional liability insurance market. For eleven years, we have been able to keep that market open for all physicians in North Carolina. Because our primary goal is stability—not profit—we will continue to serve you while other companies limit their markets or restrict coverage.

Our presence in North Carolina guarantees that experienced physicians can practice their specialties,

new physicians can begin their practices, and citizens of the state will get the high quality medical care they deserve. By bringing stability to the professional liability market, we're serving the public good.

Medical Mutual. We'll be there when you need us.

Medical Mutual
Medical Insurance Agency, Inc.

Medical Mutual Insurance Company of North Carolina and its subsidiary, Medical Insurance Agency, Inc. are located at 222 North Person Street, Raleigh, NC 27611 919/828-9334 800/662-7917

Ovarian Pregnancy

Robert V. Higgins, M.D., Jack L. Crain, M.D.

Primary ovarian pregnancy is a rare entity with approximately 300 cases reported in the literature.¹ The diagnosis is seldom made preoperatively; the pathologic specimen must meet the criteria of Spiegelberg before the diagnosis is confirmed. This is the story of our patient who met the criteria.

A 32-year-old woman Gravida 6, Para 4, Abortus 1 presented to Charlotte Memorial Hospital (CMH) with a two-day history of left lower quadrant pain. This lower abdominal pain was not accompanied by any gastrointestinal or urinary symptoms. Her last normal menstrual period was eight weeks prior to admission but she had experienced vaginal spotting ten days before admission. She was sexually active and not using any form of birth control. Significant past history included treatment for gonococcal cervicitis and IUD use for two years after the birth of her last child.

The patient was afebrile without orthostatic hypotension or tachycardia. She was in no distress. Abdominal exam revealed no tenderness, guarding, or rebound. Pelvic exam showed a soft anteverted uterus, approximately six-week size, and a nontender cystic mass in the left adnexa.

Quantitative beta-HCG level was 17,666 mIU/ml. Pelvic ultrasound showed an "empty uterus" with a 4.2 cm mass in the left adnexa.

With a HCG titer greater than 6,500 mIU/ml and no intrauterine sac seen on pelvic ultrasound, ectopic pregnancy seemed the most likely diagnosis. Therefore, diagnostic laparoscopy was utilized to determine the site of the pregnancy. Laparoscopy revealed a normal right ovary and fallopian tube with approximately 20 cc of blood in the cul-de-sac. Despite manipulation with a second puncture probe, the entire length of the left fallopian tube could not be visualized due to omental adhesions attached to the left adnexal structures. The four cm mass suggested on pelvic ultrasound was not apparent, as the left ovary was not visible.

Laparotomy confirmed the right ovary and right fallopian tube to be normal. The left fallopian tube including the fimbria were normal without adhesions or bleeding. The

left ovary, covered by small bowel and not encased in omental adhesions, contained a four cm hemorrhagic cyst. This appeared to be a hemorrhagic corpus luteum cyst without evidence of a pregnancy.

With the hemorrhagic cyst the only abnormal finding, a left ovarian cystectomy was performed. The opened cyst contained a membranous ring which appeared to represent a gestational sac. Frozen section and permanent sections confirmed an ovarian pregnancy.

Postoperatively the patient did well and was discharged home on the fifth postoperative day.

Epidemiology

The first report of an ovarian pregnancy case was written in 1682 by Saint Maurice, and numerous case reports were published subsequently.² No author has a large series due to the rarity of this problem. In 1970 Lehfeldt and associates stated that one ovarian pregnancy occurred in 40,000 deliveries.³ Recent data indicate the incidence to be approximately one in 7,000 pregnancies, or 0.7 to 1.0 per 100 ectopic pregnancies.⁴ However, it is difficult to determine whether this increased incidence is real or apparent. The increased rate may be due to a greater awareness of the problem, increased reporting, and/or a more thorough search of the pathologic specimen.

Risk factors for ovarian pregnancy appear to be similar to factors related to tubal pregnancies. These factors include a history of pelvic inflammatory disease, prior pelvic surgery, and IUD usage. The association of ovarian pregnancy with the IUD has been controversial; some authors have suggested if an IUD user has an ectopic pregnancy she has a one-in-nine chance of having an ovarian pregnancy.⁵ Subsequent work by Lehfeldt in an exhaustive study showed the IUD is 99.5% effective in preventing intrauterine pregnancies, 95% effective in preventing tubal pregnancies, and has no influence on the ovarian pregnancy rate.³

In one of the largest reviews of ovarian pregnancies, Hallatt compared 25 patients who had ovarian pregnancies with patients who had tubal pregnancies. The average age, gravidity, and percent using an IUD were not significantly different between the two groups. A distinction between these two groups was the lack of infertility in the ovarian

From the Department of Obstetrics and Gynecology, Charlotte Memorial Hospital and Medical Center, P.O. Box 32861, Charlotte 28232.

Figure 1. In the upper right, chorionic villi are encased in ovarian parenchyma. Ovarian parenchyma demonstrates a portion of the corpus luteum, and in the lower left, an ovarian follicle.

pregnancy group. Only four percent of the ovarian pregnancy patients had experienced infertility, compared to 20% in the tubal pregnancy patients.⁶

The mechanism of ovarian pregnancies is unknown. Various theories have been offered and reviewed by Boronow and associates.² Most authorities believe ovarian pregnancies are fertilized in the ampullary portion of the fallopian tube and secondarily implant on the ovary. This is based on knowledge that the oocyte is not capable of fertilization until it completes the second phase of the meiotic division which occurs after ovulation. However, some authors state fertilization can be intraovarian in the rare instance of intraovarian maturation.²

Diagnostic Criteria

In 1878, Spiegelberg outlined the pathologic requirements for an ovarian pregnancy: (1) The tube on the affected side must be normal; (2) The gestational sac must occupy the normal position of the ovary; (3) The sac must be connected to the uterus by the ovarian ligament; (4) Definite ovarian

tissue must be present in the sac wall.⁷ The photomicrograph (figure 1) demonstrates chorionic villi abutting the corpus luteum from our patient's left ovary.

Clinical Presentation

Most ovarian pregnancies are diagnosed in the first trimester and present with symptoms similar to tubal pregnancies. Hemoperitoneum may be slightly more common with ovarian pregnancies compared to tubal pregnancies due to the vascularity of the ovary.⁶ Other symptoms of an ectopic pregnancy such as abdominal pain, abnormal vaginal bleeding, and adnexal tenderness are common with ovarian pregnancies. There is no one feature in clinical presentation which differentiates an ovarian from a tubal pregnancy, though one study indicated that amenorrhea was a striking feature in ovarian pregnancies.⁸

Diagnostic studies include serum levels of beta-HCG, culdocentesis, ultrasound, and laparoscopy. Pre-operative localization of an ectopic pregnancy to the fallopian tube can be made but localization to the ovary is rare.

Management

The surgical management should be ovarian cystectomy or wedge resection, preferably with microsurgical techniques.

Grossly, an ovarian pregnancy appears as a ruptured corpus luteum or as a hemorrhagic ovary. Any further surgery should be performed only if bleeding cannot be stopped or if the patient desired permanent sterilization.⁹ The previous practice of removing the ipsilateral fallopian tube for pathologic study to rule out an initial tubal implantation site should be abandoned. ■

PERSONAL CARE PLAN

Of North Carolina

A Subsidiary of Blue Cross and Blue Shield of North Carolina

Our Alumni Make Great Recoveries.

They needed our program to solve their problems, so you probably won't hear them brag about their Alma Mater. But they're proud of us and we're proud of them, because they continue to live straight and sober *after* they leave our program.

Some people call it success. We call it recovery. And it happens because of teamwork. Our staff, our client's physician, employer, and family, all working together with each patient for the same goal: freedom from drugs and alcohol one day at a time.

Guaranteed. That's right, if a patient follows our program and doesn't remain drug and alcohol free, we'll provide additional treatment at *no charge*.

Don't lose your patients to alcohol and drugs. Get them back with our help and discover what recovery can mean for your patient's life.

We offer 24 hour free confidential evaluations and case consultations 7 days a week.

LIBRIUM®

chlordiazepoxide HCl/Roche
5-mg, 10-mg, 25-mg capsules

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Management of anxiety disorders; short-term relief of anxiety symptoms, acute alcohol withdrawal symptoms, preoperative apprehension and anxiety. Usually not required for anxiety or tension associated with stress of everyday life. Efficacy beyond four months not established by systematic clinical studies. Periodic reassessment of therapy recommended.

Contraindications: Known hypersensitivity to the drug.

Warnings: Warn patients that mental and/or physical abilities required for tasks such as driving or operating machinery may be impaired, as may be mental alertness in children, and that concomitant use with alcohol or CNS depressants may have an additive effect. Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage. Withdrawal symptoms (including convulsions) reported after abrupt cessation of extended use of excessive doses are similar to those seen with barbiturates. Milder symptoms reported infrequently when continuous therapy is abruptly ended. Avoid abrupt discontinuation; gradually taper dosage.

Usage in Pregnancy: Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically. Due to isolated reports of exacerbation, use with caution in patients with porphyria.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment, blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for maximum beneficial effects. **Oral—Adults:** Mild and moderate anxiety disorders and symptoms, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. **Geriatric patients:** 5 mg b.i.d. to q.i.d. (See Precautions.)

Supplied: Librium® (chlordiazepoxide HCl/Roche) Capsules, 5 mg, 10 mg and 25 mg—bottles of 100 and 500; Tel-E-Dose® packages of 100, available in boxes of 4 reverse-numbered cards of 25, and in boxes containing 10 strips of 10. Libritabs® (chlordiazepoxide/Roche) Tablets, 5 mg and 10 mg—bottles of 100 and 500; 25 mg—bottles of 100. With respect to clinical activity, capsules and tablets are indistinguishable.

ANNOUNCING NEW

All the advantages of cephalaxin in a convenient tablet form

- Backed by over 15 years of clinical experience
- Smaller tablet is specially shaped and coated for easier swallowing
- May enhance patient compliance, particularly among the elderly
- Tablet dosage form may be appreciated by patients of all ages

NEW Keflet Tablets are available as:

Keflet is contraindicated in patients with known allergy to the cephalosporins and should be given cautiously to penicillin-sensitive patients.

Brief Summary: Consult the package literature for prescribing information.

Indications and Usage: Keflet™ Tablets (cephalexin, Dista) are indicated for the treatment of the following infections when caused by susceptible strains of the designated microorganisms:

Respiratory tract infections caused by *Streptococcus pneumoniae* and group A β hemolytic streptococci (Penicillin is the usual drug of choice in the treatment and prevention of streptococcal infections, including the prophylaxis of rheumatic fever. Keflet is generally effective in the eradication of streptococci from the nasopharynx, however, substantial data establishing the efficacy of Keflet in the subsequent prevention of rheumatic fever are not available at present.)

Otitis media due to *S. pneumoniae*, *Haemophilus influenzae*, staphylococci, streptococci, and *Neisseria catarrhalis*

Skin and skin structure infections caused by staphylococci and/or streptococci

Bone infections caused by staphylococci and/or *Proteus mirabilis*
Genitourinary tract infections, including acute prostatitis, caused by *Escherichia coli*, *P. mirabilis*, and *Klebsiella sp.*

Note: Culture and susceptibility tests should be initiated prior to and during therapy. Renal function studies should be performed when indicated.

Contraindication: Keflet is contraindicated in patients with known allergy to the cephalosporin group of antibiotics.

Warnings: BEFORE CEPHALAXIN THERAPY IS INSTITUTED, CAREFUL INQUIRY SHOULD BE MADE CONCERNING PREVIOUS HYPERSENSITIVITY REACTIONS TO CEPHALOSPORINS AND PENICILLIN. CEPHALOSPORIN C DERIVATIVES SHOULD BE GIVEN CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS.

SERIOUS ACUTE HYPERSENSITIVITY REACTIONS MAY REQUIRE EPINEPHRINE AND OTHER EMERGENCY MEASURES.

There is some clinical and laboratory evidence of partial cross allergenicity of the penicillins and the cephalosporins. Patients have been reported to have had severe reactions (including anaphylaxis) to both drugs.

Any patient who has demonstrated some form of allergy, particularly to drugs, should receive antibiotics cautiously. No exception should be made with regard to Keflet.

Pseudomembranous colitis has been reported with virtually all broad spectrum antibiotics (including macrolides, semisynthetic penicillins, and cephalosporins); therefore, it is important to consider its diagnosis in patients who develop diarrhea in association with the use of antibiotics.

Such colitis may range in severity from mild to life-threatening. Treatment with broad-spectrum antibiotics alters the normal flora of the colon and may permit overgrowth of clostridia. Studies indicate that a toxin produced by *Clostridium difficile* is one primary cause of antibiotic-associated colitis.

Mild cases of pseudomembranous colitis usually respond to drug discontinuance alone. In moderate to severe cases, management should include sigmoidoscopy, appropriate bacteriologic studies, and fluid, electrolyte, and protein supplementation. When the colitis does not improve after the drug has been discontinued, or when it is severe, oral vancomycin is the drug of choice for antibiotic-associated pseudomembranous colitis produced by *C. difficile*. Other causes of colitis should be ruled out.

Usage in Pregnancy: Safety of this product for use during pregnancy has not been established.

Precautions: **General:** Patients should be followed carefully so that any side effects or unusual manifestations of drug idiosyncrasy may be detected. If an allergic reaction to Keflet occurs, the drug should be discontinued and the patient treated with the usual agents (eg, epinephrine or other pressor amines, antihistamines, or corticosteroids).

Prolonged use of Keflet may result in the overgrowth of nonsusceptible organisms. Careful observation of the patient is essential. If superinfection occurs during therapy, appropriate measures should be taken.

Positive direct Coombs' tests have been reported during treatment with the cephalosporin antibiotics. In hematologic studies or in transfusion cross-matching procedures when antiglobulin tests are performed on the minor side of Coombs' testing of newborns whose mothers have received cephalosporin antibiotics before parturition, it should be recognized that a positive Coombs' test may be due to the drug.

Keflet should be administered with caution in the presence of markedly impaired renal function. Under such conditions, careful clinical observation and laboratory studies should be made because safe dosage may be lower than that usually recommended.

Indicated surgical procedures should be performed in conjunction with antibiotic therapy.

As a result of administration of Keflet, a false positive reaction for glucose in the urine may occur. This has been observed with Benedict's and Fehling's solutions and also with Clinistest® tablets but not with Tes-Tape® (Glucose Enzymatic Test Strip, USP, Lilly).

Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.

Usage in Pregnancy—Pregnancy Category B: The daily oral administration of cephalaxin to rats in doses of 250 or 500 mg/kg prior to and during pregnancy, or to rats and mice during the period of organogenesis only, had no adverse effect on fertility, fetal viability, fetal weight, or litter size. Note that the safety of cephalaxin during pregnancy in humans has not been established.

Cephalaxin showed no enhanced toxicity in weanling and newborn rats as compared with adult animals. Nevertheless, because the studies in humans cannot rule out the possibility of harm, Keflet should be used during pregnancy only if clearly needed.

Nursing Mothers: The excretion of cephalaxin in the milk increased up to 4 hours after a 500-mg dose; the drug reached a maximum level of 4 µg/mL, then decreased gradually, and had disappeared 8 hours after administration. Caution should be exercised when Keflet is administered to a nursing woman.

Adverse Reactions: **Gastrointestinal:** Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment. Nausea and vomiting have been reported rarely. The most frequent side effect has been diarrhea. It was very rarely severe enough to warrant cessation of therapy. Dyspepsia and abdominal pain have also occurred. As with some penicillins and some other cephalosporins, transient hepatitis and cholestatic jaundice have been reported rarely.

Hypersensitivity: Allergic reactions in the form of rash, urticaria, angioedema, and, rarely, erythema multiforme, Stevens-Johnson Syndrome, or toxic epidermal necrolysis have been observed. These reactions usually subsided upon discontinuation of the drug. Anaphylaxis has also been reported.

Other reactions have included genital and anal pruritus, genital moniliasis, vaginitis and vaginal discharge, dizziness, fatigue, and headache. Eosinophilia, neutropenia, thrombocytopenia, and slight elevations in SGOT and SGPT have been reported.

Epithelial Ovarian Cancer

Prolonged Relapse-Free Survival Following Secondary Cytoreductive Surgery and Intraperitoneal 5-Fluorouracil

Barton R. Paschal, M.D., Charles E. Welander, M.D.

The treatment of epithelial ovarian cancer usually begins with hysterectomy, bilateral salpingo-oophorectomy, omentectomy and technically feasible cytoreductive surgery. Postoperatively, many of these patients are candidates for systemic chemotherapy, administered for the purpose of eradicating any residual disease. When chemotherapy is employed, one can assess its efficacy by performing second-look laparotomy.

The finding of macroscopic disease at the time of second-look laparotomy signals a poor prognosis. Even among those patients who subsequently undergo "optimal" secondary cytoreductive surgery (no postoperative tumor mass greater than 1.5 cm in diameter), the median survival time is only 20 months.¹ We report two patients with epithelial ovarian cancer, both of whom underwent optimal cytoreductive surgery followed by the administration of intraperitoneal (IP) 5-fluorouracil (5-FU). They achieved relapse-free survival times of 35+ and 38+ months.

Patient One

In March 1983, a 58-year-old woman with ascites and a 10 cm left adnexal mass underwent hysterectomy, bilateral salpingo-oophorectomy and omentectomy for stage II poorly differentiated endometrioid carcinoma of the ovary. She received six cycles of intravenous doxorubicin (50 mg/m²) and cisplatin (50 mg/m²) at three-week intervals between April and August 1983. Computerized tomography (CT) scan of the pelvis obtained at the beginning and another obtained just after completion of adjunctive chemotherapy revealed no abnormal masses.

In December 1983, the recurrence of ascites and the appearance of a right pleural effusion prompted the performance of an ultrasonogram of the pelvis and a diagnostic

thoracentesis. The thoracentesis did not reveal malignant cells, but the ultrasonogram disclosed a large pelvic mass. The patient underwent laparotomy in January 1984 at which time a 12x10x8 cm tumor mass wedged between the left wall of the pelvis and the rectosigmoid colon was resected *in toto*. Biopsies from multiple sites within the peritoneal cavity showed no other evidence of disease. Postoperatively, the right pleural effusion resolved spontaneously.

Three months later, the patient underwent insertion of a Tenckhoff catheter to facilitate the administration of IP 5-FU. The regimen used was one gram 5-FU in two liters Inpersol with 1.5% dextrose (Abbott Pharmaceuticals, North Chicago, IL), using a four-hour dwell-time for each of eight consecutive exchanges. Courses of IP 5-FU were administered biweekly. In June 1984, having received three cycles of IP 5-FU, the patient developed severe abdominal pain which persisted for several weeks, necessitating hospitalization and termination of IP therapy. The patient's disease-free survival time has now reached 35+ months.

Patient Two

A 61-year-old woman with lower quadrant abdominal pain and a left pelvic mass (figure 1) underwent resection of a poorly differentiated papillary adenocarcinoma arising from the left ovary in December 1981. Approximately 10% of the original tumor volume, which was adherent to the left pelvic side-wall, was unresectable. The appendix, uterus, right ovary and right fallopian tube were not identified intraoperatively, and it was incorrectly assumed that all of these had been resected previously.

Between December 1981 and May 1982, the patient received eight cycles of intravenous cyclophosphamide (500 mg/m²), doxorubicin (30 mg/m²), and cisplatin (50 mg/m²), followed by second-look laparotomy. Two 3 mm nodules on the parietal peritoneum overlying the sacrum were identified and excised, and one contained residual tumor. There was no attempt to dissect the retroperitoneal node-bearing areas.

From Asheville Hematology and Oncology Associates, P.A., Asheville 28801, and Department of Obstetrics and Gynecology, Section on Gynecologic Oncology, Bowman Gray School of Medicine, Winston-Salem 27103.

Figure 1. CT scan of the pelvis obtained in 1981 demonstrating a 10 cm left pelvic mass (arrow). In retrospect, the right ovary (a) is discernible.

The patient then received intravenous 5-FU 400 mg/m²/week between June 1982 and January 1983, followed by laparoscopy which disclosed no macroscopic disease. Cytologic examination of the peritoneal fluid, however, revealed malignant cells. Six cycles of IP 5-FU were administered via a Tenckhoff catheter between January and April 1983 using the same treatment protocol as described for Patient One. At the beginning of the fourth cycle, cytologic examination of the peritoneal fluid showed no malignant cells. All treatment was discontinued following the sixth cycle of IP 5-FU.

When the patient noted lower abdominal pain in September 1983, a CT scan was obtained which disclosed a right pelvic mass. Percutaneous needle biopsy of the mass revealed carcinoma. Laparotomy was performed in October 1983 at which time the pelvic tumor, located beneath the peritoneum in the right pelvis, was excised completely. Washings obtained intraoperatively from the peritoneal cavity revealed no malignant cells. The patient has had a relapse-free survival time of 38+ months, and has required no further therapy.

A review of this patient's microfilmed medical records disclosed that she had undergone appendectomy and right salpingectomy in 1942. At the time of abdominal hysterectomy in 1967, both ovaries were identified. Apparently the right ovary was tucked beneath the right pelvic peritoneum during surgical closure of the pelvic peritoneum following hysterectomy. As a result, the right ovary escaped detection by the surgeon who performed the initial and the second ovarian cancer operations. Retrospective review of a CT scan from 1981 shows the right ovary to be present (figure 1).

Discussion

Approximately 60% of patients with advanced ovarian car-

cinoma who are clinically free of tumor and undergo second-look laparotomy will have histopathologic and/or cytologic evidence of residual cancer. Among those patients with residual cancer, two-thirds will have macroscopic disease.^{2,3} The presence of macroscopic tumor at the time of second-look laparotomy indicates a poor prognosis.¹

The lack of consistently effective therapy for patients with residual disease at the time of second-look laparotomy, and the fact that such residual disease is often confined to the peritoneal cavity, have prompted the development of IP chemotherapy. A variety of agents, including 5-FU, have been evaluated for use in this setting.^{4,5} Pharmacokinetic studies demonstrate that when 5-FU is administered directly into the peritoneal cavity, the IP drug concentration exceeds the plasma drug concentration by a factor of 300:1.⁶ The clinical utility of an IP/plasma concentration gradient is illustrated by the second patient's response to IP 5-FU, which followed the failure of intravenous 5-FU to provide any measurable benefit.

An atypical feature of the second patient's management is the fact that unilateral rather than bilateral oophorectomy was performed in 1981, because the presence of the right ovary was not appreciated at that time. The right ovary escaped detection again during second-look laparotomy. Had the patient undergone routine dissection of the retroperitoneal lymph nodes during either of these two operations, the right ovary should have been noted and resected, thereby obviating the need for the third surgery. A more comprehensive review of the patient's previous pelvic operations might also have resulted in recognition at an earlier time that the right ovary was still present.

The fact that the right ovary represented the only site of residual disease at the time of the third laparotomy for ovarian cancer suggests that the right ovary may have served as a "tumor sanctuary" during the administration of chemotherapy. An analogous situation exists in men with metastatic germ cell cancer of the testis who do not undergo ipsilateral orchiectomy prior to attaining a complete response to chemotherapy. In such cases, the ipsilateral testis can become a sanctuary for testicular cancer.⁷

Previous reports concerning the use of IP 5-FU in patients with ovarian cancer are confined to two studies conducted by the National Cancer Institute (NCI).^{8,9} In a phase II study of IP 5-FU performed in 14 patients with refractory ovarian cancer, one patient (who had no tumor mass greater than 2 mm in diameter following second-look laparotomy) achieved a complete response (relapse-free survival, 36+ months).⁸ In the other report, 12 patients with no residual disease at the time of second-look laparotomy were randomly assigned to receive either no further therapy or six cycles of IP 5-FU. Of the six patients who received IP 5-FU, four patients have remained free of disease, attaining relapse-free survival times of 52+ months or longer, while the other two patients who received IP 5-FU have relapsed. In contrast, of the six patients who received no IP 5-FU, only one patient has remained free of recurrent tumor.⁹

In the phase II study of IP 5-FU conducted at the NCI, moderate to severe abdominal pain was observed during or after 30-50% of the treatment cycles.⁸ If IP 5-FU is ever to gain acceptance as a therapeutic tool, the incidence and severity of treatment-related abdominal pain must be reduced. By applying to patients who receive IP 5-FU the same measures that are employed to treat chemotherapy extravasations, one might reduce the degree of peritoneal irritation associated with the use of this drug. For example, the IP administration of dialysate that has not been warmed fully to body temperature might exert an anti-inflammatory effect upon the peritoneum through a mechanism analogous to that which has been observed when cold is applied to the sites of doxorubicin extravasation.¹⁰ The systemic or IP administration of histamine receptor antagonists and/or glucocorticoids might also be explored for use in this setting.

Like 5-FU, cisplatin possesses antitumor activity when administered via the IP route. Indeed, among ovarian cancer patients who have undergone optimal secondary cytoreductive surgery and have residual disease, IP cisplatin affords complete response rates which are superior to those observed following the use of IP 5-FU (33% vs 13%). Since the antitumor activity of IP cisplatin in ovarian cancer surpasses that of IP 5-FU, the clinical utility of IP 5-FU may not lie in its use as a single-agent, but rather in its use (sequentially or concomitantly) with other IP agents.

A direct relationship between tumor size and response to therapy is probably extant for all IP drugs.^{4,8,11} Accordingly, ovarian cancer patients who have small-volume disease either at the time of second-look laparotomy or following debulking surgery represent a target population for whom IP therapy might prove useful. Other potential candidates for this approach to therapy include patients with no tumor at the time of restaging operation who, because of certain clinical characteristics, also have a high risk of developing recurrent disease.^{9,12-15} In regard to the use of IP 5-FU in particular, it is important to bear in mind the fact that, to date, IP 5-FU has yet to effect a complete response in any ovarian cancer patient whose largest residual tumor nodule exceeds 2 mm in diameter.⁸

Our case reports illustrate a number of important points. First of all, it is useful not only to review completely the nature of previous pelvic operations in patients in whom a diagnosis of ovarian cancer is entertained, but also to carry out a thorough exploration of the pelvis whenever surgery for ovarian cancer is performed. Second, the resistance of a given patient's ovarian cancer to intravenous 5-FU does not preclude the possibility of a subsequent response to IP 5-FU. Third, long-term relapse-free survival times are achievable in ovarian cancer patients who have macroscopic disease at the time of second-look operation, assuming that cytoreduction has occurred or will occur to such an extent

that IP agents such as 5-FU can exert a therapeutic effect.

Although the optimal integration of IP chemotherapy into multimodality treatment programs for ovarian cancer will require additional investigation, this novel approach to therapy is already a useful addition to the cancer specialist's therapeutic armamentarium. ■

THE MEDICAL SECRETARY'S OFFICE SYSTEM

Finally — First time ever, forms processing software perfectly customized for medical offices' applications. Cut forms processing time in half!!!!!!

We are offering to let you use a PROTYPE FREE for one week. If you think it's impossible for a typewriter to cut a medical secretary's typing time in half, we understand.

That's why we're offering to let you prove it for yourself.

DESIGNED FOR THE MEDICAL OFFICE, the PROTYPE is your typewriter. It's your word processor, it is compatible with your personal computer. The PROTYPE is truly unique.

ZIPS THROUGH FORMS. Our machine is the greatest medical forms processing machine ever invented. Even new forms, with many carbons can be put into the the PROTYPE and processed quickly and accurately. No need to erase!

The DATAPRO REPORT: "It's almost perfect."

NEWSWEEK: "Its ease of operation may be its greatest advantage."

POWER OF A WORD PROCESSOR: You can change it, delete it, fix it, rearrange it — and if you really mess up — our magic "UNDO" key will wonderfully put everything back just like it was before.

It's a special typewriter and word processor and form processing system and companion to a personal computer—who ever heard of a typewriter that shares PC files—what is done on a personal computer can be transferred to the PROTYPE—and vice versa

CALL TODAY AND ASK FOR YOUR FREE TRIAL. Oh, yes it does have a 62,000 word spelling dictionary, line drawing, linear graphics included.

Neurological-Otological Treatment of Acoustic Tumors

at the Wake Forest University Medical Center

Charles L. Branch, Jr., M.D., B. Hill Britton, M.D.
and David L. Kelly, Jr., M.D.

Cerebellopontine angle tumors account for 5-10% of all primary brain tumors. Of these, 80-90% are acoustic tumors (schwannomas); the remainder are meningiomas and epidermoid tumors (cholesteatomas). Contemporary treatment of these neoplasms is curative surgical resection with attempted preservation of the VIIth (facial) and VIIIth (vestibulocochlear) cranial nerves, and other surrounding neurovascular structures.

Prior to 1917 the operative mortality from these procedures had approached 80%. However, that year, Harvey Cushing, with a subtotal resection and meticulous technique, decreased the mortality to 7.7%.¹ Only eight years later, in 1925, Walter Dandy accomplished curative, or total, removal without a significant increase in mortality. In the 1960s William House, an otologist, and Robert Rand, a neurosurgeon, developed microsurgical approaches for the resection of these tumors that resulted in an even lower morbidity.^{1,2} The microsurgical technique ushered in an era not only of safer curative surgical resection but also of attempted preservation of both the facial nerve and functional hearing.

Development of the air-contrast computed tomographic (CT) scan, the subsequent development of water-soluble contrast agents (metrizamide, iohexol, iopamidol), and the more recent development of magnetic resonance imaging have facilitated early, rapid, and minimally invasive diagnosis of acoustic tumors. The most recent development in the early diagnosis and treatment of these tumors is the use of the neurosurgical-otological team. The skills of the neurosurgeons and the otologists are combined to provide for the complete removal of acoustic tumors with preservation of the anatomy and function of the involved nerves and surrounding tissues. Sophisticated preoperative and intraoperative evaluations of facial and vestibulocochlear nerve

Arrows indicate acoustic tumor.

function have further facilitated attempts at that preservation.

We review the neurosurgical-otological team's experience in the treatment of patients with acoustic tumors at the Wake Forest University Medical Center since the inception of the team in 1984.

From the Sections on Neurosurgery and Otolaryngology, Department of Surgery, Wake Forest University Medical Center, Winston-Salem 27103.

Table 1**Presenting Symptoms in 26 Patients with Acoustic Tumors**

Hearing loss	23
Tinnitus	14
Dizziness	16
Headache	5
Trigeminal nerve palsy	5
Brainstem/cerebellar compression	2
Facial nerve palsy	1
Hydrocephalus	1
Dementia	1

Clinical Material

Between March 26, 1984, and July 1, 1986, 26 patients underwent surgical removal of acoustic tumors as a combined neurosurgical-otological procedure. Their ages ranged from 22 to 72 years (mean, 54 years). They fell equally into categories of male and female, left- and right-sided tumors. Tumor size was determined primarily by preoperative CT scan. Sixteen tumors (62%) were small (less than 2 cm in diameter, and including intracanalicular lesions); eight tumors (31%) were medium in size (greater than 2 cm but less than 4 cm in diameter); and two tumors (7%) were larger than 4 cm in diameter.

The primary presenting symptom was hearing loss (23 patients, 88%), which was classified as mild ($n = 8$), moderate ($n = 9$), or severe ($n = 6$). Dizziness, brainstem dysfunction with a cranial nerve palsy, and brainstem dysfunction with hydrocephalus were the primary signs and symptoms in the remaining patients (table 1).

The diagnostic workup included audiometry with vestibular and/or brainstem-evoked responses in 23 patients (88%), magnetic resonance imaging in eight patients, and CT scanning in all patients. While CT scanning of the posterior fossa with air or with water-soluble contrast has excellent diagnostic capacity of even the small intracanalicular tumor, the refinements of magnetic resonance imaging technology may soon make it the diagnostic study of choice for these tumors.

Results

There was no operative mortality. Other complications were few (20%) and most were easily treated: Cerebrospinal fluid (CSF) leakage that stopped spontaneously ($n = 1$); CSF leakage that required reclosure ($n = 3$); and trigeminal nerve palsy that required transient tarsorrhaphy ($n = 2$).

Twenty-four patients had complete tumor removal; the two patients with tumors much larger than 4 cm in diameter had partial tumor removal.

In all cases, intraoperative facial nerve function was monitored with continuous electromyographic testing and, where appropriate, auditory function was monitored with brainstem auditory-evoked responses.

The facial nerve was preserved anatomically in all pa-

Table 2**Incidence of Preserved Facial Nerve and Auditory Function in Patients with Acoustic Tumors**

Modality	Functional		
	Preop	Intraop	Postop (10 months)
Facial	25	25	22
Auditory	18	9	7

tients, but immediate postoperative facial nerve function did not always correlate with anatomic preservation. In the patient with a facial nerve palsy preoperatively, no change was seen postoperatively. In the 25 patients with intact facial nerve function preoperatively, 12 (48%) had normal facial nerve function, 12 (48%) had a partial palsy, and one (4%) had a complete palsy immediately after operation. These palsies resolved in all but three patients by 10 months (table 2), for a facial nerve function morbidity of 12%.

An attempt to preserve hearing was made in the 18 patients with significant preoperative auditory function. The cochlear nerve was salvageable in nine (50%), and of the nine, seven (39%) had residual hearing postoperatively (table 2).

No recurrence or significant growth of residual tumor has been seen over the 10 to 18 months of followup to date. At six months' followup, 23 patients (88%) had resumed preoperative activity, and three patients remained partially disabled. In only one of the latter three was the result considered poor.

Discussion

Technologic advances, including high-resolution computed tomography with air or water-soluble contrast and magnetic resonance imaging in conjunction with sensitive auditory and vestibular testing, have made possible the relatively noninvasive early diagnosis even of small acoustic tumors. The operating microscope with microinstrumentation, augmented by high-speed drills, ultrasonic aspirator and laser technology, facilitates removal of these tumors and larger cerebellopontine lesions. Advances in neuroanesthesia and intraoperative physiologic monitoring complete the triad of means by which total removal of acoustic tumors is possible with functional preservation of surrounding structures in a large percentage of cases.

An acoustic neurinoma, while its clinical presentation may vary, should be suspected if one (or several) of the following clinical syndromes is encountered: (1) a unilateral progressive hearing loss, often noted first by an inability to understand a person speaking on the telephone; (2) unilateral tinnitus; (3) unexplained, persistent dizziness, unsteadiness, or ataxia; (4) unilateral facial numbness or pain; or (5) progressive facial weakness or twitching. Certainly the patient with one or more of these findings warrants further

evaluation by an otologist, a neurosurgeon, or both to detect or rule out a cerebellopontine angle lesion. High-resolution CT scanning with the infusion of contrast material and with particular emphasis being placed on the internal auditory canal and the cerebellopontine angle is the best first step in evaluating patients with these symptoms.

This report confirms the value of combining the skills of a neurosurgeon and an otologist in the management of patients with acoustic tumors. In our series, there were no operative deaths, 92% of patients had complete tumor resection, and 85% have had an excellent outcome; no tumor recurrences have been seen during the 10 to 18 months of followup to date. While most recent reports indicate preservation of facial function in 65% to 85% of patients,²⁻⁵ 88% of the patients in our series who had had intact facial nerve function before operation maintained that function 10 months after tumor removal. Half of the tumors in these 23 patients had been larger than 2 cm in diameter. Certainly, as these tumors are detected and surgically removed earlier, complete preservation of facial function can be anticipated.

Preservation of functional hearing is also a reality with the contemporary management of these tumors. Jannetta and colleagues⁶ reported functional hearing in 66% of patients with small (less than 2.5 cm in diameter) tumors, while Wade and House⁷ and Ojemann and colleagues⁸ reported postoperative functional hearing in 35% of patients with acoustic tumors of any size. Our ability to preserve some hearing in 39% of patients with preoperative functional hearing and acoustic tumors of any size compares favorably with those results. The size of the tumor may adversely affect the overall outcome, and certainly hearing is more easily preserved if the tumor being removed is small.^{6,8}

In our series, there were no postoperative hematomas, brainstem infarctions or injury, and no deaths, as have been reported in larger series.⁹

Both translabyrinthine and suboccipital transmeatal approaches were used in our series, but we used the latter more often, and we are currently using it exclusively. We

have not found it advantageous to use a combined suboccipital and translabyrinthine approach advocated by others.^{10,11} Intraoperative monitoring of the facial nerve appears to facilitate identification and preservation of this structure. ■

PHYSICIANS, SCHEDULE SOME TIME FOR YOUR COUNTRY.

Many physicians would like to devote some time to their country in a local Army Reserve unit. We know that making a weekend commitment can be difficult for most physicians. So it is practical for the Army Reserve units to be flexible about time. It's worth discussing.

Incidentally, in addition to satisfying your own desire to serve your country, there are exceptional opportunities to do something totally different from a day-to-day routine. Opportunities to study new areas of medicine, meet new people in your specialty, and be a part of one of the world's most advanced medical teams.

Discuss the opportunities with our Army Medical Personnel Counselor.

FOR SURGEONS LOOKING FOR A CHALLENGE.

Your challenge could be the Army Reserve unit near you. It's a unit that requires the services of surgeons.

You may wish to explore the challenge of teaching in a major medical center. You may wish to explore the special challenges of your specialty in triage. Certainly you'll be confronted by challenges very different from your daily routine.

You'll also have an opportunity to participate in a number of programs in which you'll be able to exchange views and information with other surgeons from all over the country.

The Army Reserve understands the time demands on a busy physician, so you can count on us to be totally flexible in making time for you to share your specialty with your country. We'll arrange your training program to work with your practice.

To find out about the benefits of serving with a nearby Army Reserve unit, we recommend you call our Army Medical Personnel Counselor.

PHYSICIANS, THERE ARE TWO KINDS OF FLEXIBILITY IN THE ARMY RESERVE WE THINK YOU'LL LIKE.

One, time. We know how tough it is for a busy physician to make weekend time commitments. So we offer flexible training programs that allow a physician to share some time with his or her country. We arrange a schedule to suit your requirements.

Two, the opportunity to explore other phases of medicine, to add a different kind of knowledge—the challenge of military health care. It's a flexibility which could prove to be both stimulating and rewarding, with the opportunity to participate in a variety of programs that can put you in contact with medical leaders from all over the country.

See how flexible we can be, call our Army Medical Personnel Counselor.

**ARMY RESERVE.
BE ALL YOU CAN BE.**

HERE'S ONE DOCTOR WHO WON'T PAY HIS MALPRACTICE PREMIUMS THIS YEAR.

The Army covers his premiums. Since he's an Army Physician, there are a lot of worries associated with private practice that he won't have to contend with. Like excessive paperwork, and the overhead costs incurred in running a private practice.

What he will get is a highly challenging, highly rewarding experience. The Army offers varied assignments, chances to specialize, or further your education, and to work with a team of dedicated health care professionals. Plus a generous benefits package.

If you're interested in practicing high quality health care with a minimum of administrative burdens, examine Army medicine. Talk to your local Army Medical Department Counselor for more information.

To show you how many
hypertensives stayed on

INDERAL[®] LA
(PROPRANOLOL HCl)

after a major nationwide trial...

...we had
to find
just the
right room.

60,073 patients (90%) who started on INDERAL[®] LA stayed on INDERAL LA.^{1*}

Surprising? Not really.

Because most patients on INDERAL LA (propranolol HCl) don't even know it's working.

A recent double-blind, placebo-controlled, crossover study in 138 hypertensive patients² revealed that INDERAL LA has a side effects profile unsurpassed by atenolol or metoprolol — which shows how well-tolerated once-daily INDERAL LA can be.

Sole therapy or concomitant therapy?

Fifty-nine percent of the time, INDERAL LA stood on its own.

The patients in the nationwide compliance trial were no different from yours. Generally when the antihypertensive regimen is complicated, compliance may become a problem. So, the effectiveness of INDERAL LA as once-daily monotherapy is a big plus. Of the remaining hypertensives in the program, 36% were treated merely with the addition of a diuretic to INDERAL LA.

For the noncompliant patients in your practice, INDERAL LA may well be the answer.

Almost 20,000 of the patients in the nationwide compliance trial were identified as having been noncompliant with their previous antihypertensive therapy. Their physicians reported that 88% showed improved compliance when placed on once-daily INDERAL LA.

Control, comfort, and compliance

ONCE-DAILY
INDERAL[®] LA
(PROPRANOLOL HCl) LONG ACTING CAPSULES

Like conventional INDERAL Tablets, INDERAL LA should not be used in the presence of congestive heart failure, sinus bradycardia, cardiogenic shock, heart block greater than first degree, and bronchial asthma.

*After a 30-day trial with INDERAL LA, physicians reported that 90% of the patients would remain on INDERAL LA.

The one you know best keeps looking better

Please see next page for brief summary of prescribing information

The one you know best keeps looking better

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION SEE PACKAGE CIRCULAR)

INDERAL® LA brand of propranolol hydrochloride (Long Acting Capsules)

DESCRIPTION. Inderal LA is formulated to provide a sustained release of propranolol hydrochloride. Inderal LA is available as 60 mg, 80 mg, 120 mg, and 160 mg capsules.

CLINICAL PHARMACOLOGY. Inderal LA is a nonselective, beta-adrenergic receptor-blocking agent possessing no other autonomic nervous system activity. It specifically competes with beta-adrenergic receptor-stimulating agents for available receptor sites. When access to beta-receptor sites is blocked by Inderal LA, the chronotropic, inotropic, and vasodilator responses to beta-adrenergic stimulation are decreased proportionately.

Inderal LA Capsules (60, 80, 120, and 160 mg) release propranolol HCl at a controlled and predictable rate. Peak blood levels following dosing with Inderal LA occur at about 6 hours and the apparent plasma half-life is about 10 hours. When measured at steady state over a 24-hour period the areas under the propranolol plasma concentration-time curve (AUCs) for the capsules are approximately 60% to 65% of the AUCs for a comparable divided daily dose of Inderal LA Tablets. The lower AUCs for the capsules are due to greater hepatic metabolism of propranolol, resulting from the slower rate of absorption of propranolol. Over a twenty-four (24) hour period blood levels are fairly constant for about twelve (12) hours then decline exponentially.

Inderal LA should not be considered a simple mg-for-mg substitute for conventional propranolol and the blood levels achieved do not match (are lower than) those of two to four times daily dosing with the same dose. When changing to Inderal LA from conventional propranolol, a possible need for retitration upwards should be considered especially to maintain effectiveness at the end of the dosing interval. In most clinical settings, however, such as hypertension or angina where there is little correlation between plasma levels and clinical effect, Inderal LA has been therapeutically equivalent to the same mg dose of conventional propranolol, as assessed by 24-hour effects on blood pressure and on 24-hour exercise responses of heart rate, systolic pressure and rate pressure product. Inderal LA can provide effective beta blockade for a 24-hour period.

INDICATIONS AND USAGE. Hypertension: Inderal LA is indicated in the management of hypertension, it may be used alone or used in combination with other antihypertensive agents. Particularly a thiazide diuretic. Inderal LA is not indicated in the management of hypertensive emergencies.

Angina Pectoris Due to Coronary Atherosclerosis: Inderal LA is indicated for the long-term management of patients with angina pectoris.

Migraine: Inderal LA is indicated for the prophylaxis of common migraine headache. The efficacy of propranolol in the treatment of a migraine attack that has started has not been established and propranolol is not indicated for such use.

Hypertrophic Subaortic Stenosis: Inderal LA is useful in the management of hypertrophic subaortic stenosis, especially for treatment of exertional or other stress-induced angina, palpitations, and syncope. Inderal LA also improves exercise performance. The effectiveness of propranolol hydrochloride in this disease appears to be due to a reduction of the elevated outflow pressure gradient which is exacerbated by beta-receptor stimulation. Clinical improvement may be temporary.

CONTRAINDICATIONS. Inderal LA is contraindicated in 1) cardiogenic shock, 2) sinus bradycardia and greater than first-degree block, 3) bronchial asthma, 4) congestive heart failure (see WARNINGS) unless the failure is secondary to a tachyarrhythmic treatable with Inderal LA.

WARNINGS. CARDIAC FAILURE. Sympathetic stimulation may be a vital component supporting circulatory function in patients with congestive heart failure, and its inhibition by beta blockade may precipitate more severe failure. Although beta blockers should be avoided in overt congestive heart failure, if necessary, they can be used with close follow-up in patients with a history of failure who are well compensated and are receiving digitalis and diuretics. Beta-adrenergic blocking agents do not abolish the inotropic action of digitalis on heart muscle.

IN PATIENTS WITHOUT A HISTORY OF HEART FAILURE, continued use of beta blockers can, in some cases, lead to cardiac failure. Therefore, at the first sign or symptom of heart failure, the patient should be digitalized and/or treated with diuretics, and the response observed closely, or Inderal LA should be discontinued (gradually, if possible).

IN PATIENTS WITH ANGINA PECTORIS, there have been reports of exacerbation of angina and, in some cases, myocardial infarction, following abrupt discontinuance of Inderal LA therapy. Therefore, when discontinuance of Inderal LA is planned the dosage should be gradually reduced over at least a few weeks, and the patient should be cautioned against interruption or cessation of therapy without the physician's advice. If Inderal LA therapy is interrupted and exacerbation of angina occurs, it is usually advisable to reinstitute Inderal LA therapy and take other measures appropriate for the management of unstable angina pectoris. Since coronary artery disease may be unrecognized, it may be prudent to follow the above advice in patients considered at risk of having occult atherosclerotic heart disease who are given propranolol for other indications.

Nonallergic Bronchospasm (eg, chronic bronchitis, emphysema) — PATIENTS WITH BRONCHOSPASTIC DISEASES SHOULD IN GENERAL NOT RECEIVE BETA BLOCKERS. Inderal LA should be administered with caution since it may block bronchodilation produced by endogenous and exogenous catecholamine stimulation of beta receptors.

MAJOR SURGERY. The necessity or desirability of withdrawal of beta-blocking therapy prior to major surgery is controversial. It should be noted, however, that the impaired ability of the heart to respond to reflex adrenergic stimuli may augment the risks of general anesthesia and surgical procedures.

Inderal LA (propranolol HCl), like other beta blockers, is a competitive inhibitor of beta-receptor agonists and its effects can be reversed by administration of such agents, eg, dobutamine or isoproterenol. However, such patients may be subject to protracted severe hypotension. Difficulty in starting and maintaining the heartbeat has also been reported with beta blockers. **DIABETES AND HYPOLYCEMIA.** Beta blockers should be used with caution in diabetic patients if a beta-blocking agent is required. Beta blockers may mask tachycardia occurring with hypoglycemia, but other manifestations such as dizziness and sweating may not be significantly affected. Following insulin-induced hypoglycemia, propranolol may cause a delay in the recovery of blood glucose to normal levels.

THYROTOXICOSIS. Beta blockade may mask certain clinical signs of hyperthyroidism. Therefore, abrupt withdrawal of propranolol may be followed by an exacerbation of symptoms of hyperthyroidism, including thyroid storm. Propranolol may change thyroid function tests, increasing T_4 and reverse T_3 and decreasing T_3 .

IN PATIENTS WITH WOLFF-PARKINSON-WHITE SYNDROME, several cases have been reported in which, after propranolol, the tachycardia was replaced by a severe bradycardia requiring a demand pacemaker. In one case, this resulted after an initial dose of 5 mg propranolol.

PRECAUTIONS. GENERAL. Propranolol should be used with caution in patients with impaired hepatic or renal function. Inderal LA (propranolol HCl) is not indicated for the treatment of hypertensive emergencies.

Beta-adrenoreceptor blockade can cause reduction of intraocular pressure. Patients should

be told that Inderal LA may interfere with the glaucoma screening test. Withdrawal may lead to a return of increased intraocular pressure.

CLINICAL LABORATORY TESTS. Elevated blood urea levels in patients with severe heart disease, elevated serum transaminase, alkaline phosphatase, lactate dehydrogenase.

DRUG INTERACTIONS. Patients receiving catecholamine-depleting drugs such as reserpine should be closely observed if Inderal LA is administered. The added catecholamine-blocking action may produce an excessive reduction of resting sympathetic nervous activity which may result in hypotension, marked bradycardia, vertigo, syncopal attacks, or orthostatic hypotension.

Caution should be exercised when patients receiving a beta blocker are administered a calcium-channel-blocking drug, especially intravenous verapamil, for both agents may depress myocardial contractility or atrioventricular conduction. On rare occasions, the concomitant intravenous use of a beta blocker and verapamil has resulted in serious adverse reactions, especially in patients with severe cardiomyopathy, congestive heart failure or recent myocardial infarction.

Aluminum hydroxide gel greatly reduces intestinal absorption of propranolol.

Ethanol slows the rate of absorption of propranolol.

Phenyltol, phenobarbital, and rifampin accelerate propranolol clearance.

Chlorpromazine, when used concomitantly with propranolol, results in increased plasma levels of both drugs.

Antipyrine and lidocaine have reduced clearance when used concomitantly with propranolol.

Thyroxine may result in a lower than expected T_3 concentration when used concomitantly with propranolol.

Cimetidine decreases the hepatic metabolism of propranolol, delaying elimination and increasing blood levels.

Theophylline clearance is reduced when used concomitantly with propranolol.

CARCINOGENESIS, MUTAGENESIS, IMPAIRMENT OF FERTILITY. Long-term studies in animals have been conducted to evaluate toxic effects and carcinogenic potential. In 18-month studies in both rats and mice, employing doses up to 150 mg/kg/day, there was no evidence of significant drug-induced toxicity. There were no drug-related tumorigenic effects at any of the dosage levels. Reproductive studies in animals did not show any impairment of fertility that was attributable to the drug.

PREGNANCY. Pregnancy Category C. Inderal LA has been shown to be embryotoxic in animal studies at doses about 10 times greater than the maximum recommended human dose.

There are no adequate and well-controlled studies in pregnant women. Inderal LA should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

NURSING MOTHERS. Inderal LA is excreted in human milk. Caution should be exercised when Inderal LA (propranolol HCl) is administered to a nursing woman.

PEDIATRIC USE. Safety and effectiveness in children have not been established.

ADVERSE REACTIONS. Most adverse effects have been mild and transient and have rarely required the withdrawal of therapy.

Cardiovascular. Bradycardia, congestive heart failure, intensification of AV block, hypotension, parosmia, numbness of hands, thrombocytopenic purpura, arterial insufficiency, usually of the Raynaud type.

Central Nervous System. Light-headedness, mental depression manifested by insomnia, lassitude, weakness, fatigue, reversible mental depression progressing to cataplexy, visual disturbances, hallucinations, vivid dreams: an acute reversible syndrome characterized by

disorientation for time and place, short-term memory loss, emotional lability, slightly clouded sensorium, and decreased performance on neuropsychometric tests. For immediate formulations, fatigue, lethargy, and vivid dreams appear dose-related.

Gastrointestinal. Nausea, vomiting, epigastric distress, abdominal cramping, diarrhea, constipation, mesenteric arterial thrombosis, ischemic colitis.

Allergic. Pharyngitis and agranulocytosis, erythematous rash, fever combined with aching and sore throat, laryngospasm and respiratory distress.

Respiratory. Bronchospasm.

Hematologic. Agranulocytosis, nonthrombocytopenic purpura, thrombocytopenic purpura.

Auto-Immune. In extremely rare instances, systemic lupus erythematosus has been reported.

Miscellaneous. Alopecia, LE-like reactions, psoriasisiform rashes, dry eyes, male impotence, and Peyronie's disease have been reported rarely. Oculomucocutaneous reactions involving the skin, serous membranes and conjunctivae reported for a beta blocker (proclolol) have not been associated with propranolol.

DOSEAGE AND ADMINISTRATION. Inderal LA provides propranolol hydrochloride in a sustained-release capsule for administration once daily. If patients are switched from Inderal LA Tablets to Inderal LA Capsules, care should be taken to assure that the desired therapeutic effect is maintained. Inderal LA should not be considered a simple mg-for-mg substitute for Inderal LA. Inderal LA has different kinetics and produces lower blood levels. Retitration may be necessary, especially to maintain effectiveness at the end of the 24-hour dosing interval.

HYPERTENSION. Dosage must be individualized. The usual initial dosage is 80 mg Inderal LA once daily, whether used alone or added to a diuretic. The dosage may be increased to 120 mg once daily or higher until adequate blood-pressure control is achieved. The usual maintenance dosage is 120 to 160 mg once daily. In some instances a dosage of 640 mg may be required. The time needed for full hypertensive response to a given dosage is variable and may range from a few days to several weeks.

ANGINA PECTORIS. Dosage must be individualized. Starting with 80 mg Inderal LA once daily, dosage should be gradually increased at three- to seven-day intervals until optimal response is obtained. Although individual patients may respond at any dosage level, the average optimal dosage appears to be 160 mg once daily. In angina pectoris, the value and safety of dosage exceeding 320 mg per day have not been established.

Treatment is to be discontinued, reduce dosage gradually over a period of a few weeks (see WARNINGS).

MIGRAINE. Dosage must be individualized. The initial oral dose is 80 mg Inderal LA once daily. The usual effective dose range is 160-240 mg once daily. The dosage may be increased gradually to achieve optimal migraine prophylaxis. If a satisfactory response is not obtained within four to six weeks after reaching the maximal dose, Inderal LA therapy should be discontinued. It may be advisable to withdraw the drug gradually over a period of several weeks.

HYPERTROPHIC SUBAORTIC STENOSIS. 80-160 mg Inderal LA once daily.

PEDIATRIC DOSAGE. At this time the data on the use of the drug in this age group are too limited to permit adequate directions for use.

A Bright Sun Obscures the Stars

W. Blair Brooks, M.D.

Problems with the pursuit of one diagnosis at a time.

Evaluation of chest pain can be expensive, time consuming, and involve significant risk. Patients with chest pain fear coronary artery disease; physicians evaluating these patients are afraid of missing this diagnosis. This combination of fears and the increasing public demand for technologically advanced diagnostic tests leads to a workup of chest pain limited to "ruling out heart disease." Only after the "cardiac workup" is completed are other potential diagnoses or contributing factors (esophageal, musculoskeletal, psychological) explored. Postponing the evaluation of noncardiac diagnoses results in unnecessary invasive testing.

Almy¹ has emphasized that too often internists explore psychosocial etiologies as a retreat after a specific organic disease has been "completely ruled out." He recommends evaluating these areas concurrently. I learned this lesson (again) in a patient I saw recently. The true etiology of the patient's chest pain was revealed only after an extensive and expensive cardiac workup was negative.

The patient's intense fear of coronary artery disease and her knowledge of the symptoms of angina affected the manner in which she presented her symptoms and the way in which I interpreted them. Our fear of missing coronary artery disease was clearly fueled by abnormal tests which further served to focus our energy on excluding heart disease. Had I been successful in hearing historical clues that suggested a noncardiac cause of the chest pain, treatment and resolution of the symptoms might have occurred earlier, and the invasive testing might have been avoided.

Case Report

A 45-year-old premenopausal woman came to Duke Medical Center for evaluation of a six-month history of substernal chest pain. The pain had occurred once a month since its onset and would last up to several hours. These

painful episodes were followed by two to three days of chest tightness and soreness.

She described the dull pain during the three most severe episodes as "like an elephant sitting on my chest." The pain radiated down her left arm and was associated with nausea, diaphoresis, palpitations, and two syncopal episodes. She stated, "These pains are just like my brother's heart attack pain." What I did not realize at the time was that she was extrapolating from her brother's pain. Even at her first visit to Duke, she was convinced that her pain represented coronary artery disease and her descriptions of the symptoms reflected this concern.

There were aspects of her history that should have compelled me to aggressively pursue noncardiac causes of the pain. The severe episodes had occurred on the golf course (later I discovered that the episodes always happened after she had swung a golf club) and while answering the telephone at work. They were not related to exertion; brisk walking, her most demanding exercise, never brought on the pain. On several occasions she had gone to an emergency room during episodes of chest pain and her electrocardiograms showed no acute ischemic changes. She had been placed on propranolol and sublingual nitroglycerin; the latter promptly improved the pain but she was left with a residual soreness.

Although her history was suggestive of angina, it also had histrionic features; in addition to the chest pain, she complained of many other somatic symptoms including chronic nausea, bilateral hand numbness, alternating constipation and diarrhea, and intermittent lightheadedness. This myriad of symptoms certainly didn't exclude the presence of coronary artery disease but should have heightened my awareness of possible contributing personality factors.

On reflection, I see reasons why I was diverted onto the cardiac tangent.² She did have impressive cardiac risk factors including hypertension (blood pressure 150/100), a positive family history (her father and two brothers had suffered myocardial infarctions in their early forties), obesity (150% ideal body weight), borderline hypercholesterolemia (250 mg/dl), and a 10 pack year smoking history. Although her

From Division of General Internal Medicine, Duke University Medical Center, Durham 27710.

physical examination was completely normal, her resting ECG was abnormal with deep QS waves in VI and V2, suggestive of an old anteroapical myocardial infarction.

After the initial evaluation, I embarked on a workup to rule out heart disease even though my intuition was that her pain was not angina. I felt compelled to explain the abnormal ECG and to reassure myself about the cardiac risk factors before further understanding her histrionic personality style and the nonexertional nature of the pain. As we proceeded, the patient and I lost sight of the alternative noncardiac diagnoses. Even in retrospect, I do not think I could have avoided pursuing the cardiac workup at this point; however, simultaneous evaluation of non-cardiac causes would have been useful. Had I been able to maintain the diagnostic evaluation at more than one level, the alternative diagnoses and possible treatments could have become clear earlier.

Lisansky and Shochet emphasize the importance of developing a "comprehensive" diagnosis that involves both the medical problem and the psychosocial context of the illness.³ The importance of the psychosocial context of this patient's symptoms became more evident to me after the cardiac workup was completed. At the time, however, I did not stop to reassess; we plunged ahead.

The Cardiac Workup

The workup began with a treadmill exercise test which I felt would be helpful in confirming or dispelling the diagnosis of angina. In order to assess better the potential usefulness of the stress test, I used Pryor et al's estimates of the likelihood of coronary artery disease.⁴ These estimates are based on the clinical assessment of the type of pain (typical angina, atypical angina, or nonangina), cardiac risk factors, and ECG evidence of prior myocardial damage. The calculated probability of coronary artery disease in patients similar to my 45-year-old woman with "atypical angina" and an abnormal ECG is 56%. Had I decided that the pain was nonanginal, the pretest probability of heart disease would have been 32%.

How would the outcome of the stress test affect the probability estimates of coronary artery disease in this patient? A positive stress test (2-2.5 mm ST depression) would increase the likelihood of having significant disease from 56% to 74%; a negative stress test (no ST depression) would decrease the likelihood to 18%.

On the other hand, had I decided that the patient's pain was nonanginal, the utility of the stress test would have been affected significantly: a positive test would only increase the probability of coronary artery disease from 32% to 54% while a negative test would decrease the probability from 32% to 12%. Had I been firmly convinced that the chest pain was nonanginal, the stress test would not have had the potential to be as helpful and I would have had to depend less on diagnostic testing and more on historical details. I was less wise then.

The patient underwent the stress test and achieved a max-

imum heart rate of 150. The test was terminated because of fatigue during stage III of the Bruce protocol. There was 2 mm ST segment depression in leads II, III, AVF, and V5; these results were considered "positive," giving the patient a 74% probability of significant coronary artery disease. Because of the positive stress test, the patient's age, and her family history, a cardiologist recommended cardiac catheterization. The patient underwent this procedure and was found to have normal coronary arteries, normal left ventricular function, and a negative ergonovine provocative test for coronary artery spasm.

Subsequent workup for a GI source of the pain (esophageal manometry and upper endoscopy) was unrevealing.

Pursuing Noncardiac Diagnoses

Now the patient and I were "forced" to look for alternative explanations of the chest pain. Before the cardiac catheterization, the focus had been on the possible relationship between exertion and pain. We went back over the history and the patient described two episodes of pain that began when she was sitting at her desk and reaching out in front of her to lift some books off a shelf. The episodes began with the sudden onset of what she called "crushing" substernal chest pain followed by sweating, nausea, and near-syncope. Co-workers who observed the patient during her pain noted a slow pulse rate suggestive of a vagal episode. This description of the pain was far more detailed than before and suggested that reaching brought on the pain. Now that both the patient and I were unbiased by the fear of coronary artery disease, a far different interpretation of the symptoms had emerged.

I saw her shortly after an episode of chest pain and for the first time (three months after the initial visit) she had tender costochondral junctions. I prescribed Motrin and her pain improved. Over the next six months she continued to have occasional episodes of chest pain brought on when she reached over her head to lift even light objects. She is no longer taking nitroglycerin and is not as frightened by the pain. She has improved her level of activity and, although initially reluctant to accept a noncardiac cause of her chest pain, she now exhibits significantly less concern about her cardiac status.

Her pain on the golf course and in the work place was precipitated by acute costochondritis. The pain in turn precipitated a vasovagal reaction which caused her angina-like symptoms. Her positive family history sensitized her to the possibility of cardiac disease, and when she developed chest pain, the underlying anxiety about heart disease resulted in the vasovagal response.

Discussion

What is remarkable about this case history is that nearly all the evidence for this explanation for her pain was available

to me at the patient's initial visit. Nevertheless, it is understandable that the abnormal test results provoked our pursuit of the cardiac evaluation. I continue to relearn that patients and physicians often collude by entertaining only one diagnostic possibility at a time. It is difficult not to fall into this trap. Simultaneous evaluation of several diagnostic possibilities is a skill that needs to be cultivated and nurtured constantly. The patient benefits from this multidimensional approach by earlier diagnosis and treatment and sometimes by avoidance of the risk, discomfort and expense of unnecessary testing.

There is perhaps a larger point. Although the patient and I agreed upon a mechanism for the pain that made sense to both of us, it is unlikely that this explanation represents the whole "truth." The chest pain is but one of a constellation of symptoms I will certainly encounter in this patient in the future. To attribute her pain to a simple mechanism (and to believe in this explanation) is to fall into the same trap that led to the cardiac testing. I now better appreciate the phys-

ical, psychological and historical factors that contribute to the patient's symptoms, but this is the beginning rather than the end of my investigation. Arriving at this mutually acceptable mechanism for the pain only *allows* me the opportunity to progress toward a better understanding of the underlying factors that contribute to her symptoms. The complexity of her symptoms is just now unfolding. ■

The Generator That Makes Other Generators Obsolete!

The New Bennett 80 Programmable

AUTO-TECH®

Advanced technology has enabled B & B X-Ray, Inc. to offer you the Bennett 80 Programmable Auto-Tech, a generator that offers you *accuracy*, *convenience*, and *efficiency*. With Auto-Tech you never have to measure anatomical parts or equate factors from technique charts. The Bennett Auto-Tech has 80 pre-programmed technique selections for which anatomical parts are automatically measured by sonar and converted into optimum kVp and mAs using the shortest exposure time and highest mA possible. This technique saves you time and money by producing consistently optimum quality radiographs and eliminating costly repeated exposures. In fact, we're so confident in the performance of the Auto-Tech that it has a *seven-year warranty!*

And, as with all Bennett equipment, it is built with a modular concept in mind. It allows you to design a radiographic system for your present and future needs by selecting the basic system and adding optional accessories. Also, the Auto-Tech can be reprogrammed to suit your film/screen combinations and your specific needs. Now you know why the New 80-Programmable Auto-Tech is making other generators obsolete.

Addiction

New Versions of an Old Problem

Theodore R. Clark, M.D.

I got into the alcohol treatment field as a scared child watering my dad's Scotch so he wouldn't get drunk and fight with my mother. Early on, I decided to be a psychiatrist in order to solve all of the family problems that I thought caused the drinking.

In my turn, I started "partying" and ended up in psychotherapy for a severe drinking problem. The therapy wouldn't work and I started self-medicating with tranquilizers and sleeping pills to avoid being an alcoholic. As a result, I wound up being addicted to drugs and alcohol simultaneously and, after several unsuccessful psychiatric hospitalizations, I bottomed out in a state hospital violent ward, tied down hand and foot with convulsions and DTs.

After that, I abandoned traditional psychiatric approaches of the time and sought help in a self-help group that featured abstinence in conjunction with massive emotional and spiritual support. This worked so well for me that I embarked on an odyssey of building treatment programs around these principles.

I have noted an explosion of the Minnesota Model Treatment Center around the country. North Carolina is no exception; at least ten formal 28-day treatment programs have sprung up in the last decade since alcoholism was decriminalized, and focus has been on recovery from a disease often genetic in predisposition.

I have had a unique opportunity to see alcoholism redefined by the American Medical Association as a disease and to see folk medicine (Alcoholics Anonymous and Narcotics Anonymous) transformed into a state-of-the-art group therapy in the 1970s and 1980s. I have observed major emphasis being placed on better understanding and treatment of family members, spouses and children as well. Adult Children of Alcoholics (ACOA), self-help groups and formal therapy programs are developing for this special form of dysfunctional family.

The drinking or drugging, which may have been stimulated by peer pressure, availability, or present or past stressors, for some people takes on a "life of its own" and propels the person into the downward spiral of addiction.

This inevitably leads to lack of control and recurrent guilt around compromised value systems. The addict becomes less and less the person he wanted to be, becomes defensive, full of alibis and broken promises, and finally starts to isolate in order to avoid the disappointment that shows in the eyes of the people who matter most.

"Geographical cures," broken homes, progressive self-centered bitterness lead to increased sense of loneliness, depression, anxiety, distortion, loss of social skills. Suicide, or the "fractional suicide" associated with continued drug or alcohol use at this stage of the disease, is often the outcome.

All of this is the same as it was twenty years ago, or for that matter, fifty years ago when I started watering drinks. What is new is the epidemic use of drugs (especially cocaine) along with the alcohol. It used to be that the majority of alcoholics could keep up a semblance of normality and stay work-compensated until their late 30s or even longer in some cases. Nowadays, people are routinely addicted to a variety of drugs, and alcohol may only be a second or third choice.

With polyaddiction, or with cocaine being the predominant drug, the downhill slide may take only four years. When cocaine is inhaled directly into the lungs as freebase or as the new inexpensive smokeable "crack," it has the same effect as when taken intravenously. The concentration in the brain reaches a very high peak and the patient immediately wants more to avoid the "crashing phenomenon" when the drug wears off. This leads to a rapid decompensation to the point where hospitalization may occur within the first year due to complete debilitation.

We are now seeing teenagers "wiped out" by cocaine and other street drugs. They show up in the treatment center needing extensive rehabilitation. Most of these adolescents have a strong familial history of alcoholism.

An unforgettable case would be a 19-year-old with multiple arrests for selling "crack" to support his own habit. This included, at times, giving samples to other youngsters, which is often the way children are initiated into cocaine use. The patient had hepatitis, severe Valium and heroin withdrawal on top of a cocaine psychosis and had a strong suicidal urge. It was weeks before the patient stopped drug

From Dartmouth Clinic, P.A., 140 S.W. Broad St., Southern Pines 28387.

seeking and was mentally clear enough to participate in group therapy.

The solutions are for the most part the same. That is, the safe detox from the alcohol or drug concerned. This may include clonidine for narcotics or sometimes tricyclic antidepressants to restore the neurotransmitter levels depleted by cocaine. This is followed by group and one-to-one counseling in support groups with other people recovering from similar problems. Various educational programs are designed to break through the denial and reinforce the abstinence model, providing hope and acceptance. In this open and assuring system, depression is replaced with hope, par-

anoia gives way to trust and the ability to share with others. Social skills are either relearned or learned for the first time, in the case of adolescents, and the group as a whole can recover from fear and isolation, delusion and despair, despite the fact that not one member in that group could do it on his own.

"Together we could do what none of us could do alone." This provides a heightened spiritual feeling amongst members of the group which often translates into a sense of "God could do for us what we could not do for ourselves."

An old problem, a new problem, an old wisdom with a new application. ■

Dillard

HEALTHCARE SERVICES

P.O. Box 21767, Greensboro, NC 27420 (919) 299-1211

IT JUST MAKES GOOD CENTS!

WHAT? A special cooperative group purchasing program between Dillard Healthcare Services and the North Carolina Medical Society.

HOW? By saving members 10% to 25% on patient-care products and office supplies used in any kind of practice. All of the state's Medical Society members are treated as one customer, but are able to receive individual deliveries on a full line of supplies. Dillard has offices in Raleigh, Charlotte, Greensboro, Winston-Salem, Wilmington and Greenville, S.C.

WHY NOT take a closer look at the product and price listing mailed to you in June? If you have any questions call your nearest Dillard branch and ask for the physician sales representative listed below.

GET STARTED NOW! Save on patient-care products and office supplies. The program, which is exclusively available to NCMS members, benefits the Society as well.

The "Crack" in the Emergency Room Door

Daniel G. Sayers, M.D.

In the beginning, Yvonne was just an abstraction on the Emergency Department radio to me. I took the call one afternoon last summer.

"We have a woman in her 30s," the EMT in the field reported. "She's conscious, combative and needs restraints."

On the upper level of a Victorian style house, she had injected herself with crack, the most potent form of cocaine.

When I examined Yvonne, she responded to stimuli only slightly. Pain would cause a withdrawal movement that was incomplete but identifiable. Her irises were thin rims around widely dilated pupils that reacted sluggishly to light. Her breathing was deep and rapid. Barely present at her wrists was a rapid, shallow pulse.

The results of her lab work painted a grim picture. The ECG showed that her heart was severely compromised. Also grim were the numbers that showed moderate kidney failure and liver dysfunction. We were faced with multiple organ failure, changes in mental status and poisoning from crack.

Modern medicine offered me few weapons with which to fight Yvonne's problem. I felt helpless and frustrated. We did what we could, but it made no difference in her immediate condition. Within 36 hours of injecting herself, she could no longer breathe without a respirator and her prognosis was grave. Three days later, in the intensive care unit, she died.

Yvonne had been careful with her injection. Her husband told me that the two of them had never used crack before, and that they had little idea of how easy it was to overdose. They had used cocaine several times with no side effects, and they had gradually increased their use of the drug. To them, the world seemed a happier, more exciting place when they used cocaine. It couldn't harm them, they thought, because they were so young and healthy.

Yvonne never had a chance to understand what hit her. She never stood outside herself to see the decline from abuse to addiction to death. Her plight resembled that of the trauma patient who is in a coma from the moment of impact. Her chances of survival, however, were considerably worse.

I found it disconcerting and distressing to deal with the inevitable death of a productive person who abused herself. Yvonne found drugs more fun than reality. Her death reminded me that drug abuse is a disease of our society. Realizing that was bitter medicine. ■

Letters to the Editor

On Dr. Crist's editorial

To the Editor:

It was with great understanding and empathy, as a mental health professional, that I read the editorial in the November issue of the *Medical Journal*, *Sobering Thoughts* (Crist et al, 1986;47:511), and the various letters to the editor in response (1987;48;45-7).

In point, the Crist article did lean to an extreme in language and, perhaps, imprudence in statements but, nonetheless, the article speaks factually as a matter of basic truth so far as the Roman Church is concerned. Their influence and direct involvement in efforts to thwart any program of "planned family" are well known. For the good doctors that took exception, I observe that, typically, exception has been taken at words, phrases or a sentence or two. That should not be the issue. One must consider the total overall message of the subject discussed and not the mere words, per se, expressing them.

I would seek to calm their disquiet by the following summation of historical and theological facts. They, then, might consider that a different "response" would be more in keeping with reality.

Space and time constraints here do not permit — nor is it appropriate — a dissertation in philosophy, theology or marital ethics. Let it suffice to say that there is no valid premise in Natural Theology, Scripture nor Divine Revelation to support, much less justify, the Church's position on birth control. Infrequently, reference is made to Scripture (GN. 37:7-10) but even their Biblical experts cannot agree. (That is why there is no "infallible doctrine" on this point.) On their traditional mind-set about sex as a "shameful act," a position to which history alone gives irrefutable testimony (Re: *De actis Impudicitiiis*), there is no argument. Current posture directly flows from that ancient "negative."

A major article by me addressing recent Vatican pronouncements in this regard is being, or will be, printed in leading publications (news) from Bangor (ME) to Raleigh, entitled "In Defense of Birth Control."

Richard G. McDonald, Ph.D.

Kinston 28501

In appreciation of Dr. Falletta's article

To the Editor:

Dr. John M. Falletta's timely article (1987;48:41-3) on physicians as science writers raises several issues worth further discussion.

Since the only reason we write is to be read, we must learn and use the techniques that will clarify our writing.

The problems correctly identified by Dr. Falletta as causing weak medical writing — such as the overuse of passive voice, impersonal pronouns, and jargon — are not unique to the profession. They are universal characteristics of ineffective writing that show up in many substantive fields of science, technology, and business. There is nothing inherently more difficult about medical communication than in any other field.

In many instances, physicians learn to write in the obscure and stilted style by imitating the established model. That is, they actually try to write poorly in what they perceive to be the "medical style." Ironically, medical style manuals ask writers to use the clear, concise language that's characterized by active voice, well-defined terminology, helpful comparisons, concrete descriptions, and appropriate examples.

Several fears and misconceptions underlie the profession's reluctance to fully utilize medical/technical writers:

Researchers are afraid that the writer will translate a detailed report of difficult work into simple language, which will be equated with simple thinking. But plain language combined into easy-to-read sentences is descriptively powerful prose. It is writing that communicates complex and abstract ideas more clearly than a stilted, rambling, jargon-filled style.

Physicians are afraid of putting people and action into their descriptive accounts. This unreasonable and inexplicable taboo has caused more bad scientific writing than any other stylistic stricture. Writing in the impersonal passive voice is a hoax to create the impression that objective research happens on its own and that the facts speak for themselves. With the shattering of this taboo, writers are able to use I and WE to convey the obvious truth that people do the research and communicate their findings to other people.

Many experts believe that their in-depth knowledge relieves them of the responsibility of focusing on good writing technique. They assume that their expertise will come through despite any writing deficiencies. But brilliant ideas communicated unclearly are perceived by colleagues simply as unclear ideas.

Although physicians commonly refer their patients to qualified medical specialists, they seem hesitant to refer their writing to a qualified specialist. Perhaps they are reluctant to admit that a great medical mind is not necessarily a great communications mind. Or, like some other professionals, perhaps many physicians have yet to realize that writing is indeed a significant communications specialty.

How to use your medical writer:

Insist on having a medical or technical writer placed at your disposal. Then, insist on full participation and utilization of those writers as part of the team of specialists.

Get the maximum benefit out of the medical writers by bringing these specialists into the project at the start of the composition process. Researchers and administrators should demand a full role on the team for the medical writer. Limited quality results come from imposing a limited scope/role on the writer.

The medical writer's positive contribution will naturally be limited when his role is restricted to final draft brush-up or re-write of the article. At this stage, the weaknesses of organization, style, clarity and construction are so endemic that the press of meeting the deadline prevents any more than symptomatic treatment.

Finally, don't sell the medical writer short. Nobody is better qualified to present clear and precise descriptions of a project, either completed or in progress. That is his specialty. The process of explaining the subject to the writer can be a useful step in organizing the researcher's understanding of the material for presentation.

The demand for medical and scientific writers has led to the development of the technical writing emphasis within the English master's degree program at East Carolina University. Technical writing specializations are also available to undergraduates at both ECU and NCSU. Contacts with medical and scientific writing specialists can be made through local chapters of the Society for Technical Communication (STC). Carolina chapter: STC, c/o Dr. Carol Pollard, Department of English, North Carolina State University, Raleigh 27695-8105; East Carolina University student chapter: STC, c/o Dr. Jo Allen, Department of English, East Carolina University, Greenville 27858-4353.

"Sicker and quicker"

To the Editor:

A significant emerging problem facing all physicians today is concerned with the limitations placed on patient care as a result of increasing economic pressures. "Sicker and quicker discharges" are apparently increasing and will inevitably fuel patient complaints and suits. Costs and services are easy to monitor and control but actual quality patient care is difficult to measure accurately. It is essential that physicians avoid inappropriate medical decisions under the pressures of cost containment.

In the past internal peer review procedures emphasized quality care. Presently many external reviews appear to make cost a major concern. As a result medical necessity is now often in conflict with economic efficiency.

In *Wickline v. State* (Cal. Rptr. 661, 1986) a post-op patient developed complications which in the professional opinion of her attending physician required an additional eight days of hospital care. The state sponsored review organization approved only four added days and the attending physician complied. The patient later developed an infection and had her leg amputated. A jury initially awarded the patient \$500,000. This was later overturned on the grounds that the law did not permit a state program to be held liable under such circumstances. In this instance it appears to us that the efforts of the state to contain costs interfered with medical treatment but was not held accountable. This case is presently on appeal.

This case may ultimately raise questions of liability for physicians. Utilization review companies, providers, and even employers may ultimately be held liable for patient injuries in similar circumstances.

Perhaps overlooked in the PRO review process which is primarily concerned with appropriateness and the cost-effectiveness of medical care (that is both quality assurance and utilization review) is the fact that a denial letter forwarded to a beneficiary can be used by a disgruntled patient as notice that they may have grounds for a potential lawsuit.

Charlotte, 28226

A comment on Dr. Cuttino's and Drs. Koufman and Thomason's articles

To the Editor:

The first two articles in the June 1987 issue of the *Journal* (NCMJ 48:303-4 and 307-9) contain inaccuracies in their first sentences. Both Dr. Cuttino in his article on breast imaging techniques and Drs. Koufman and Thomason in their article on laser therapy of bronchogenic carcinoma state that breast cancer is the leading cause of cancer death in women. Until recently, this was true. However, lung cancer has surpassed breast cancer as the leading cause of cancer death in women and it remains the leading cause of cancer death in men. (CA 1987;37:2) This increased death rate has followed by several years the increased incidence of smoking by women.

Physicians in the state of North Carolina should understand this impact of tobacco abuse since our state is a leading producer of this carcinogen.

Continuing Medical Education

Please note: The Continuing Medical Education Programs at Bowman Gray, Duke, East Carolina (ECU) and UNC Schools of Medicine, Dorothea Dix, and Burroughs Wellcome Company are accredited by the American Medical Association. Therefore CME programs sponsored or cosponsored by these schools automatically qualify for AMA Category I credit toward the AMA's Physician Recognition Award, and for North Carolina Medical Society Category A credit. Where AAFP credit has been obtained, this also is indicated.

July 27-31

10th Annual Radiology Postgraduate Course

Place: Atlantic Beach

AUTHORS

INSTRUCTIONS FOR SUBMITTING PAPERS

Copyright of an article published in the *North Carolina Medical Journal* is retained by the author, but the copyright to each entire issue is the property of The North Carolina Medical Society, and permission to reprint all or any part of a published article must be negotiated with the author and the editor jointly. The reprinted material must carry a credit line signifying that it appeared in the *North Carolina Medical Journal*.

Medical articles, editorials, patient oriented articles, letters to the editor and all other text submitted for publication must be double-spaced throughout, including references and legends. The material should be typed on one side of the paper with 1¼ inch margins all around. Do not use an all-caps or a script typeface. Submit one original and one copy. Please be sure to include your phone number.

The author is responsible for the accuracy of all statements and references. Acronyms and other abbreviations should be kept to a minimum; *any acronym used should be fully translated in the text*. Refer to pharmaceutical products by their generic names; brand names may follow in parentheses. Units of measure should appear in the metric system. References, typed double-spaced, should be listed in the order of their citation in the text, not alphabetically. They should follow the style used in the *Journal*.

Illustrations should be black and white glossy prints or color or black and white slides, with legends typed in double-space on a separate sheet of paper. Since the *Journal* has a limited budget for color, it may be a factor in publishing color illustrations.

Attach to the two copies of the manuscript a cover letter giving the address and telephone number of the person who will correspond about it, and address the completed communication to the Editor, Box 3910, Duke University Medical Center, Durham, NC 27710.

All manuscripts are subject to editorial changes. If extensive revision is necessary, the author will receive a draft of the edited article for approval before publication.

Authors interested in more effective writing may find *The Elements of Style* by Strunk and White and *How to Write and Publish a Scientific Paper* by Day helpful.

Extracted, with permission, from *Virginia Medical* with thanks.

Limbitrol[®] (IV)

Tranquilizer—Antidepressant

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Relief of moderate to severe depression associated with moderate to severe anxiety

Contraindications: Known hypersensitivity to benzodiazepines or tricyclic antidepressants. Do not use with monoamine oxidase (MAO) inhibitors or within 14 days following discontinuation of MAO inhibitors since hyperpyretic crises, severe convulsions and deaths have occurred with concomitant use; then initiate cautiously, gradually increasing dosage until optimal response is achieved. Contraindicated during acute recovery phase following myocardial infarction.

Warnings: Use with great care in patients with history of urinary retention or angle-closure glaucoma. Severe constipation may occur in patients taking tricyclic antidepressants and anticholinergic-type drugs. Closely supervise cardiovascular patients. (Arrhythmias, sinus tachycardia and prolongation of conduction time reported with use of tricyclic antidepressants, especially high doses. Myocardial infarction and stroke reported with use of this class of drugs.) Caution patients about possible combined effects with alcohol and other CNS depressants and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving).

Usage in Pregnancy: Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Since physical and psychological dependence to chlordiazepoxide have been reported rarely, use caution in administering Limbitrol to addiction-prone individuals or those who might increase dosage; withdrawal symptoms following discontinuation of either component alone have been reported (nausea, headache and malaise for amitriptyline; symptoms [including convulsions] similar to those of barbiturate withdrawal for chlordiazepoxide).

Precautions: Use with caution in patients with a history of seizures, in hyperthyroid patients or those on thyroid medication, and in patients with impaired renal or hepatic function. Because of the possibility of suicide in depressed patients, do not permit easy access to large quantities in these patients. Periodic liver function tests and blood counts are recommended during prolonged treatment. Amitriptyline component may block action of guanethidine or similar antihypertensives. When tricyclic antidepressants are used concomitantly with cimetidine (Tagamet), clinically significant effects have been reported involving delayed elimination and increasing steady state concentrations of the tricyclic drugs. Concomitant use of Limbitrol with other psychotropic drugs has not been evaluated; sedative effects may be additive. Discontinue several days before surgery. Limit concomitant administration of ECT to essential treatment. See Warnings for precautions about pregnancy. Limbitrol should not be taken during the nursing period. Not recommended in children under 12. In the elderly and debilitated, limit to smallest effective dosage to preclude ataxia, oversedation, confusion or anticholinergic effects.

Adverse Reactions: Most frequently reported are those associated with either component alone: drowsiness, dry mouth, constipation, blurred vision, dizziness and bloating. Less frequently occurring

reactions include vivid dreams, impotence, tremor, confusion and nasal congestion. Many depressive symptoms including anorexia, fatigue, weakness, restlessness and lethargy have been reported as side effects of both Limbitrol and amitriptyline. Granulocytopenia, jaundice and hepatic dysfunction have been observed rarely.

The following list includes adverse reactions not reported with Limbitrol but requiring consideration because they have been reported with one or both components or closely related drugs:

Cardiovascular: Hypotension, hypertension, tachycardia, palpitations, myocardial infarction, arrhythmias, heart block, stroke.

Psychiatric: Euphoria, apprehension, poor concentration, delusions, hallucinations, hypomania and increased or decreased libido.

Neurologic: Incoordination, ataxia, numbness, tingling and paresthesias of the extremities, extrapyramidal symptoms, syncope, changes in EEG patterns.

Anticholinergic: Disturbance of accommodation, paralytic ileus, urinary retention, dilatation of urinary tract.

Allergic: Skin rash, urticaria, photosensitization, edema of face and tongue, pruritus.

Hematologic: Bone marrow depression including agranulocytosis, eosinophilia, purpura, thrombocytopenia.

Gastrointestinal: Nausea, epigastric distress, vomiting, anorexia, stomatitis, peculiar taste, diarrhea, black tongue.

Endocrine: Testicular swelling and gynecomastia in the male, breast enlargement, galactorrhea and minor menstrual irregularities in the female, elevation and lowering of blood sugar levels, and syndrome of inappropriate ADH (antidiuretic hormone) secretion.

Other: Headache, weight gain or loss, increased perspiration, urinary frequency, mydriasis, jaundice, alopecia, parotid swelling.

Overdosage: Immediately hospitalize patient suspected of having taken an overdose. Treatment is symptomatic and supportive. I.V. administration of 1 to 3 mg physostigmine salicylate has been reported to reverse the symptoms of amitriptyline poisoning. See complete product information for manifestation and treatment.

Dosage: Individualize according to symptom severity and patient response. Reduce to smallest effective dosage when satisfactory response is obtained. Larger portion of daily dose may be taken at bedtime. Single h.s. dose may suffice for some patients. Lower dosages are recommended for the elderly. Limbitrol DS (double strength) Tablets, initial dosage of three or four tablets daily in divided doses, increased up to six tablets or decreased to two tablets daily as required. Limbitrol Tablets, initial dosage of three or four tablets daily in divided doses, for patients who do not tolerate higher doses.

How Supplied: Double strength (DS) Tablets, white, film-coated, each containing 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt), and Tablets, blue, film-coated, each containing 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt). Available in bottles of 100 and 500, Tel-E-Dose[®] packages of 100, Prescription Paks of 50.

CRUMPTON COMPANY.

Why do so many NC physicians participate in the Crumpton Plan of Disability Income Protection?

THE ANSWER is the 47 years of successful relationship and personal service at claim time!

Yes, the feeling of security as well as economic advantage in knowing the program is a plan of carefully designed benefits.

The plan is not filled with a lot of "purple duck feathers," but provides income when you are unable to produce — not promises, but performance.

Why not call us today to obtain the latest details for your group practice? We are delighted to offer our broadened portfolio of professional insurance.

To show you how many
hypertensives stayed on

INDERAL[®] LA
(PROPRANOLOL HCl)

after a major nationwide trial...

...we had
to find
just the
right room.

60,073 patients (90%) who started on INDERAL[®] LA stayed on INDERAL LA.^{1*}

Surprising? Not really.

Because most patients on INDERAL LA (propranolol HCl) don't even know it's working.

A recent double-blind, placebo-controlled, crossover study in 138 hypertensive patients² revealed that INDERAL LA has a side effects profile unsurpassed by atenolol or metoprolol — which shows how well-tolerated once-daily INDERAL LA can be.

Sole therapy or concomitant therapy?

Fifty-nine percent of the time, INDERAL LA stood on its own.

The patients in the nationwide compliance trial were no different from yours. Generally when the antihypertensive regimen is complicated, compliance may become a problem. So, the effectiveness of INDERAL LA as once-daily monotherapy is a big plus. Of the remaining hypertensives in the program, 36% were treated merely with the addition of a diuretic to INDERAL LA.

For the noncompliant patients in your practice, INDERAL LA may well be the answer.

Almost 20,000 of the patients in the nationwide compliance trial were identified as having been noncompliant with their previous antihypertensive therapy. Their physicians reported that 88% showed improved compliance when placed on once-daily INDERAL LA.

Control, comfort, and compliance

ONCE-DAILY
INDERAL[®] LA
(PROPRANOLOL HCl) LONG ACTING CAPSULES

Like conventional INDERAL Tablets, INDERAL LA should not be used in the presence of congestive heart failure, sinus bradycardia, cardiogenic shock, heart block greater than first degree, and bronchial asthma.

*After a 30-day trial with INDERAL LA, physicians reported that 90% of the patients would remain on INDERAL LA.

The one you know best keeps looking better

Please see next page for brief summary of prescribing information.

NOW AVAILABLE...
NEW LOW DOSE
INDERAL[®] LA 60 mg
(PROPRANOLOL HCl) LONG ACTING CAPSULES

The one you know best keeps looking better

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION SEE PACKAGE CIRCULAR)

INDERAL® LA brand of propranolol hydrochloride (Long Acting Capsules)

DESCRIPTION. INDERAL LA is formulated to provide a sustained release of propranolol hydrochloride. INDERAL LA is available as 60 mg, 80 mg, 120 mg, and 160 mg capsules.

CLINICAL PHARMACOLOGY. INDERAL is a nonselective, beta-adrenergic receptor-blocking agent possessing no other autonomic nervous system activity. It specifically competes with beta-adrenergic receptor-stimulating agents for available receptor sites. When access to beta-receptor sites is blocked by INDERAL, the chronotropic, inotropic, and vasodilator responses to beta-adrenergic stimulation are decreased proportionately.

INDERAL LA Capsules (60, 80, 120, and 160 mg) release propranolol HCl at a controlled and predictable rate. Peak blood levels following dosing with INDERAL LA occur at about 6 hours and the apparent plasma half-life is about 10 hours. When measured at steady state over a 24-hour period the areas under the propranolol plasma concentration-time curve (AUCs) for the capsules are approximately 60% to 65% of the AUCs for a comparable divided daily dose of INDERAL Tablets. The lower AUCs for the capsules are due to greater hepatic metabolism of propranolol, resulting from the slower rate of absorption of propranolol. Over a twenty-four (24) hour period, blood levels are fairly constant for about twelve (12) hours then decline exponentially.

INDERAL LA should not be considered a simple mg-for-mg substitute for conventional propranolol and the blood levels achieved do not match (are lower than) those of two to four times daily dosing with the same dose. When changing to INDERAL LA from conventional propranolol, a possible need for retitration upwards should be considered especially to maintain effectiveness at the end of the dosing interval. In most clinical settings, however, such as hypertension or angina where there is little correlation between plasma levels and clinical effect, INDERAL LA has been therapeutically equivalent to the same mg dose of conventional INDERAL as assessed by 24-hour effects on blood pressure and on 24-hour exercise responses of heart rate, systolic pressure and rate pressure product. INDERAL LA can provide effective beta blockade for a 24-hour period.

INDICATIONS AND USAGE. **Hypertension:** INDERAL LA is indicated in the management of hypertension; it may be used alone or used in combination with other antihypertensive agents, particularly a thiazide diuretic. INDERAL LA is not indicated in the management of hypertensive emergencies.

Angina Pectoris Due to Coronary Atherosclerosis: INDERAL LA is indicated for the long-term management of patients with angina pectoris.

Migraine: INDERAL LA is indicated for the prophylaxis of common migraine headache. The efficacy of propranolol in the treatment of a migraine attack that has started has not been established and propranolol is not indicated for such use.

Hypertrophic Subaortic Stenosis: INDERAL LA is useful in the management of hypertrophic subaortic stenosis, especially for treatment of exertional or other stress-induced angina, palpitations, and syncope. INDERAL LA also improves exercise performance. The effectiveness of propranolol hydrochloride in this disease appears to be due to a reduction of the elevated outflow pressure gradient which is exacerbated by beta-receptor stimulation. Clinical improvement may be temporary.

CONTRAINDICATIONS. INDERAL is contraindicated in 1) cardiogenic shock, 2) sinus bradycardia and greater than first-degree block, 3) bronchial asthma, 4) congestive heart failure (see WARNINGS) unless the failure is secondary to a tachyarrhythmia treatable with INDERAL.

WARNINGS. **CARDIAC FAILURE.** Sympathetic stimulation may be a vital component supporting circulatory function in patients with congestive heart failure, and its inhibition by beta blockade may precipitate more severe failure. Although beta blockers should be avoided in overt congestive heart failure, if necessary, they can be used with close follow-up in patients with a history of failure who are well compensated and are receiving digitalis and diuretics. Beta-adrenergic blocking agents do not abolish the inotropic action of digitalis on heart muscle.

IN PATIENTS WITHOUT A HISTORY OF HEART FAILURE, continued use of beta blockers can, in some cases, lead to cardiac failure. Therefore, at the first sign or symptom of heart failure, the patient should be digitalized and/or treated with diuretics, and the response observed closely, or INDERAL should be discontinued (gradually, if possible).

IN PATIENTS WITH ANGINA PECTORIS, there have been reports of exacerbation of angina and in some cases, myocardial infarction, following abrupt discontinuance of INDERAL therapy. Therefore, when discontinuance of INDERAL is planned, the dosage should be gradually reduced over at least a few weeks, and the patient should be cautioned against interruption or cessation of therapy without the physician's advice. If INDERAL therapy is interrupted and exacerbation of angina occurs, it usually is advisable to reinstitute INDERAL therapy and take other measures appropriate for the management of unstable angina pectoris. Since coronary artery disease may be unrecognized, it may be prudent to follow the above advice in patients considered at risk of having occult atherosclerotic heart disease who are given propranolol for other indications.

Nonallergic Bronchospasm (eg, chronic bronchitis, emphysema)—PATIENTS WITH BRONCHOSPASTIC DISEASES SHOULD IN GENERAL NOT RECEIVE BETA BLOCKERS. INDERAL should be administered with caution since it may block bronchodilation produced by endogenous and exogenous catecholamine stimulation of beta receptors.

MAJOR SURGERY. The necessity or desirability of withdrawal of beta-blocking therapy prior to major surgery is controversial. It should be noted, however, that the impaired ability of the heart to respond to reflex adrenergic stimuli may augment the risks of general anesthesia and surgical procedures.

INDERAL (propranolol HCl), like other beta blockers, is a competitive inhibitor of beta-receptor agonists and its effects can be reversed by administration of such agents, eg, dobutamine or isoproterenol. However, such patients may be subject to protracted severe hypotension. Difficulty in starting and maintaining the heartbeat has also been reported with beta blockers.

DIABETES AND HYPOGLYCEMIA. Beta blockers should be used with caution in diabetic patients if a beta-blocking agent is required. Beta blockers may mask tachycardia occurring with hypoglycemia, but other manifestations such as dizziness and sweating may not be significantly affected. Following insulin-induced hypoglycemia, propranolol may cause a delay in the recovery of blood glucose to normal levels.

THYROTOXICOSIS. Beta blockade may mask certain clinical signs of hyperthyroidism. Therefore, abrupt withdrawal of propranolol may be followed by an exacerbation of symptoms of hyperthyroidism, including thyroid storm. Propranolol may change thyroid function tests, increasing T_4 and reverse T_3 and decreasing T_3 .

IN PATIENTS WITH WOLFF-PARKINSON-WHITE SYNDROME, several cases have been reported in which, after propranolol, the tachycardia was replaced by a severe bradycardia requiring a demand pacemaker. In one case, this resulted after an initial dose of 5 mg propranolol.

PRECAUTIONS. **GENERAL.** Propranolol should be used with caution in patients with impaired hepatic or renal function. INDERAL (propranolol HCl) is not indicated for the treatment of hypertensive emergencies.

Beta-adrenoreceptor blockade can cause reduction of intraocular pressure. Patients should

be told that INDERAL may interfere with the glaucoma screening test. Withdrawal may lead to a return of increased intraocular pressure.

CLINICAL LABORATORY TESTS. Elevated blood urea levels in patients with severe heart disease, elevated serum transaminase, alkaline phosphatase, lactate dehydrogenase.

DRUG INTERACTIONS. Patients receiving catecholamine-depleting drugs such as reserpine should be closely observed if INDERAL is administered. The added catecholamine-blocking action may produce an excessive reduction of resting sympathetic nervous activity which may result in hypotension, marked bradycardia, vertigo, syncope attacks, or orthostatic hypotension.

Caution should be exercised when patients receiving a beta blocker are administered a calcium-channel-blocking drug, especially intravenous verapamil, for both agents may depress myocardial contractility or atrioventricular conduction. On rare occasions, the concomitant intravenous use of a beta blocker and verapamil has resulted in serious adverse reactions, especially in patients with severe cardiomyopathy, congestive heart failure or recent myocardial infarction.

Aluminum hydroxide gel greatly reduces intestinal absorption of propranolol.

Ethanol slows the rate of absorption of propranolol.

Phenylton, phenobarbital, and rilampin accelerate propranolol clearance.

Chlorpromazine, when used concomitantly with propranolol, results in increased plasma levels of both drugs.

Antipyrine and lidocaine have reduced clearance when used concomitantly with propranolol.

Thyroxine may result in a lower than expected T_3 concentration when used concomitantly with propranolol.

Cimetidine decreases the hepatic metabolism of propranolol, delaying elimination and increasing blood levels.

Theophylline clearance is reduced when used concomitantly with propranolol.

CARCINOGENESIS, MUTAGENESIS, IMPAIRMENT OF FERTILITY. Long-term studies in animals have been conducted to evaluate toxic effects and carcinogenic potential. In 18-month studies in both rats and mice, employing doses up to 150 mg/kg/day, there was no evidence of significant drug-induced toxicity. There were no drug-related tumorigenic effects at any of the dosage levels. Reproductive studies in animals did not show any impairment of fertility that was attributable to the drug.

PREGNANCY. Pregnancy Category C. INDERAL has been shown to be embryotoxic in animal studies at doses about 10 times greater than the maximum recommended human dose.

There are no adequate and well-controlled studies in pregnant women. INDERAL should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

NURSING MOTHERS. INDERAL is excreted in human milk. Caution should be exercised when INDERAL (propranolol HCl) is administered to a nursing woman.

PEDIATRIC USE. Safety and effectiveness in children have not been established.

ADVERSE REACTIONS. Most adverse effects have been mild and transient and have rarely required the withdrawal of therapy.

Cardiovascular. Bradycardia, congestive heart failure, intensification of AV block, hypotension, paresthesia of hands, thrombocytopenic purpura, arterial insufficiency, usually of the Raynaud type.

Central Nervous System. Light-headedness, mental depression manifested by insomnia, lassitude, weakness, fatigue, reversible mental depression progressing to cataplexy, visual disturbances, hallucinations, vivid dreams, an acute reversible syndrome characterized by disorientation for time and place, short-term memory loss, emotional lability, slightly clouded sensorium, and decreased performance on neuropsychometrics. For immediate formulations, fatigue, lethargy and vivid dreams appear dose related.

Gastrointestinal. Nausea, vomiting, epigastric distress, abdominal cramping, diarrhea, constipation, mesenteric arterial thrombosis, ischemic colitis.

Allergic. Pharyngitis and agranulocytosis, erythematous rash, fever combined with aching and sore throat, laryngospasm and respiratory distress.

Respiratory. Bronchospasm.

Hematologic. Agranulocytosis, nonthrombocytopenic purpura, thrombocytopenic purpura.

Auto-Immune. In extremely rare instances, systemic lupus erythematosus has been reported.

Miscellaneous. Alopecia, LE-like reactions, psoriasisiform rashes, dry eyes, male impotence, and Peyronie's disease have been reported rarely. Oculomucocutaneous reactions involving the skin, serous membranes and conjunctivae reported for a beta blocker (practolol) have not been associated with propranolol.

DOSAGE AND ADMINISTRATION. INDERAL LA provides propranolol hydrochloride in a sustained-release capsule for administration once daily. If patients are switched from INDERAL Tablets to INDERAL LA Capsules, care should be taken to assure that the desired therapeutic effect is maintained. INDERAL LA should not be considered a simple mg-for-mg substitute for INDERAL. INDERAL LA has different kinetics and produces lower blood levels. Retitration may be necessary, especially to maintain effectiveness at the end of the 24-hour dosing interval.

HYPERTENSION.—Dosage must be individualized. The usual initial dosage is 80 mg INDERAL LA once daily, whether used alone or added to a diuretic. The dosage may be increased to 120 mg once daily or higher until adequate blood-pressure control is achieved. The usual maintenance dosage is 120 to 160 mg once daily. In some instances a dosage of 640 mg may be required. The time needed for full hypertensive response to a given dosage is variable and may range from a few days to several weeks.

ANGINA PECTORIS.—Dosage must be individualized. Starting with 80 mg INDERAL LA once daily, dosage should be gradually increased at three- to seven-day intervals until optimal response is obtained. Although individual patients may respond at any dosage level, the average optimal dosage appears to be 160 mg once daily. In angina pectoris, the value and safety of dosage exceeding 320 mg per day have not been established.

If treatment is to be discontinued, reduce dosage gradually over a period of a few weeks (see WARNINGS).

MIGRAINE.—Dosage must be individualized. The initial oral dose is 80 mg INDERAL LA once daily. The usual effective dose range is 160-240 mg once daily. The dosage may be increased gradually to achieve optimal migraine prophylaxis. If a satisfactory response is not obtained within four to six weeks after reaching the maximal dose, INDERAL LA therapy should be discontinued. It may be advisable to withdraw the drug gradually over a period of several weeks.

HYPERTROPHIC SUBAORTIC STENOSIS.—80-160 mg INDERAL LA once daily.

PEDIATRIC DOSAGE.—At this time the data on the use of the drug in this age group are too limited to permit adequate directions for use.

Y

You are the final quality control step

Behind each bottle of Cortisporin® Otic is thirty years of clinical experience. Behind that are forty million bottles sold in the last decade without a single recall.

Before Cortisporin Otics reach the pharmacy, they've passed 95 stringent quality control checks. You're the last, and the most important. Without you, Cortisporin Otic can't help your patients. Remember...

Write "Do Not Substitute."

CORTISPORIN® OTIC SUSPENSION/SOLUTION* (Sterile) (polymyxin B-neomycin-hydrocortisone)

Burroughs Wellcome Co.
Research Triangle Park
North Carolina 27709

CORTISPORIN® OTIC Suspension Sterile (Polymyxin B-Neomycin-Hydrocortisone) Description: Each cc contains: Aerosporin® (Polymyxin B Sulfate) 10,000 units. Neomycin sulfate (equivalent to 3.5 mg neomycin base) 5 mg. Hydrocortisone 10 mg (1%). The vehicle contains the inactive ingredients cetyl alcohol, propylene glycol, polysorbate 80, water for injection and thimerosal (preservative) 0.01%. **Indications:** For the treatment of superficial bacterial infections of the external auditory canal caused by organisms susceptible to the action of the antibiotics, and for the treatment of infections of mastoidectomy and fenestration cavities caused by organisms susceptible to the antibiotics. **Precautions:** This drug should be used with care in cases of perforated eardrum and in long-standing cases of chronic otitis media because of the possibility of ototoxicity caused by neomycin. **CORTISPORIN® OTIC Solution Sterile (Polymyxin B-Neomycin-Hydrocortisone)** Description: Each cc contains: Aerosporin® (Polymyxin B Sulfate) 10,000 units. Neomycin sulfate (equivalent to 3.5 mg neomycin base) 5 mg. Hydrocortisone 10 mg (1%). The vehicle contains the inactive ingredients cupric sulfate, glycerin, hydrochloric acid, propylene glycol, water for injection and potassium metabisulfite (preservative) 0.1%. **Indications:** For the treatment of superficial bacterial infections of the external auditory canal caused by organisms susceptible to the action of the antibiotics. **Warning:** Contains potassium metabisulfite, a sulfite that may cause allergic-type reactions (e.g., hives, itching, wheezing, anaphylaxis) in certain susceptible persons. Although the overall prevalence of sulfite sensitivity in the general population is probably low, it is seen more frequently in asthmatics or in atopic nonasthmatic persons. **Precautions:** This drug should be used with care when the integrity of the tympanic membrane is in question because of the possibility of ototoxicity caused by neomycin. **Adverse Reactions:** Stinging and burning have been reported when this drug has gained access to the middle ear. **Contraindications, Warnings, Precautions and Adverse**

Reactions Common to Both Products. Contraindications: These products are contraindicated in those individuals who have shown hypersensitivity to any of the components, and in herpes simplex, vaccinia and varicella. **Warnings:** As with other antibiotic preparations, prolonged treatment may result in overgrowth of nonsusceptible organisms and fungi. If the infection is not improved after one week, cultures and susceptibility tests should be repeated to verify the identity of the organism and to determine whether therapy should be changed. When using neomycin-containing products to control secondary infection in the chronic dermatoses, such as chronic otitis externa, it should be borne in mind that the skin in these conditions is more liable than is normal skin to become sensitized to many substances, including neomycin. The manifestation of sensitization to neomycin is usually a low grade reddening with swelling, dry scaling and itching; it may be manifest simply as a failure to heal. During long-term use of neomycin-containing products, periodic examination for such signs is advisable and the patient should be told to discontinue the product if they are observed. These symptoms regress quickly on withdrawing the medication. Neomycin-containing applications should be avoided for that patient thereafter. **Precautions:** If sensitization or irritation occurs, medication should be discontinued promptly. Patients who prefer to warm the medication before using should be cautioned against heating the solution above body temperature, in order to avoid loss of potency. Treatment should not be continued for longer than ten days. Allergic cross-reactions may occur which could prevent the use of any or all the following antibiotics for the treatment of future infections: kanamycin, paromomycin, streptomycin, and possibly gentamicin. **Adverse Reactions:** Neomycin is a not uncommon cutaneous sensitizer. There are articles in the current literature that indicate an increase in the prevalence of persons sensitive to neomycin.

*Caution: If perforation of the eardrum exists, specify Cortisporin Otic Suspension (this drug should be used with care in cases of perforated eardrum).

OFFICERS — 1987-1988

President	Henry J. Carr, Jr., M.D., 603 Beaman St., Clinton 28328
President-Elect	Ernest B. Spangler, M.D., Drawer X-3, Greensboro 27402

What Does It Take To Practice In Virginia?

Good Form.

The curriculum vitae form from the Virginia Health Council is the smart way to locate practice opportunities in Virginia. After all, the Council has been helping place physicians for nearly 40 years. To receive a form, contact the Virginia Health Council at 3312 W. Cary St., Richmond, Va. 23221; (804) 358-9946.

Virginia Health Council

Specify Adjunctive

LIBRAX

Each capsule contains 5 mg chlordiazepoxide HCl and 2.5 mg clidinium bromide

Please consult complete prescribing information, a summary of which follows:

- * **Indications:** Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the indications as follows: "Possibly" effective: as adjunctive therapy in the treatment of peptic ulcer and in the treatment of the irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis. Final classification of the less-than-effective indications requires further investigation.

Contraindications: Glaucoma; prostatic hypertrophy, benign bladder neck obstruction; hypersensitivity to chlordiazepoxide HCl and/or clidinium Br.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants, and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Physical and psychological dependence rarely reported on recommended doses, but use caution in administering Librium® (chlordiazepoxide HCl/Roche) to known addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions) reported following discontinuation of the drug.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy. Advise patients to discuss therapy if they intend to or do become pregnant.

As with all anticholinergics, inhibition of lactation may occur. **Precautions:** In elderly and debilitated, limit dosage to smallest effective amount to preclude ataxia, oversedation, confusion (no more than 2 capsules/day initially; increase gradually as needed and tolerated). Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider pharmacology of agents, particularly potentiating drugs such as MAO inhibitors, phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions reported in psychiatric patients. Employ usual precautions in treating anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship not established.

Adverse Reactions: No side effects or manifestations not seen with either compound alone reported with Librax. When chlordiazepoxide HCl is used alone, drowsiness, ataxia, confusion may occur, especially in elderly and debilitated; avoidable in most cases by proper dosage adjustment, but also occasionally observed at lower dosage ranges. Syncope reported in a few instances. Also encountered: isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent, generally controlled with dosage reduction; changes in EEG patterns may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice, hepatic dysfunction reported occasionally with chlordiazepoxide HCl, making periodic blood counts and liver function tests advisable during protracted therapy. Adverse effects reported with Librax typical of anticholinergic agents, i.e., dryness of mouth, blurring of vision, urinary hesitancy, constipation. Constipation has occurred most often when Librax therapy is combined with other spasmolytics and/or low residue diets.

When brain and bowel conflict...

It's time for the Peacemaker.

In irritable bowel syndrome* anxiety can aggravate intestinal symptoms, which may further intensify anxiety — a distressing cycle of brain/bowel conflict. Librax intervenes with two well-known compounds. The Librium® (chlordiazepoxide HCl/Roche) component safely relieves anxiety. And Quarzan® (clidinium bromide/Roche) provides antisecretory and antispasmodic action to relieve discomfort associated with intestinal hypermotility.

Dual action — for peace between brain and bowel. Because of possible CNS effects, caution patients about engaging in activities requiring complete mental alertness. Specify Adjunctive

LIBRAX®

Each capsule contains 5 mg chlordiazepoxide HCl
and 2.5 mg clidinium bromide

*Librax has been evaluated as possibly effective as adjunctive therapy in the treatment of peptic ulcer and the irritable bowel syndrome.

Not Just A Name Without A Face

For over 70 years, Saint Albans Hospital has offered the highest quality of psychiatric care.

At the center of this care are the fine physicians on the Active Medical Staff of Saint Albans Hospital. Their concern is reflected in the treatment given each and every patient. Through specialized programs for adolescents, senior adults, those with chemical dependencies and those with eating disorders, our physicians work to restore their patients to full recovery.

When you have a patient in need of psychiatric help, call one of our doctors, knowing your patient will receive the best care possible.

Committee and Commission Appointments 1987-1988

NOTE: The committees listed herein have been authorized by President Henry J. Carr, Jr., M.D., and/or as required under the Constitution and Bylaws and the Procedure and Policy Manual. Particular note should be taken of the authorization of the HOUSE OF DELEGATES of a commission form of organization activity and that all committees, excepting MEDIATION COMMITTEE, NOMINATING COMMITTEE, COUNCIL ON REVIEW & DEVELOPMENT, COORDINATING COUNCIL OF SPECIALTY SOCIETIES, are segregated under the respective commission in which the function of the committee logically rests. This will tend to eliminate overlapping and duplication in activity programs and result in coordination of the work of the Society in a manner to lessen the work of the Delegates during the Annual Meeting of the HOUSE OF DELEGATES.

Superior figures (e.g. 21) indicate the component county society from which the member emanates, as in the membership list of the ROSTER.)

COUNCILOR DISTRICTS
Constitution and Bylaws of the
North Carolina Medical Society

Article VI — Section and District Societies

The House of Delegates may divide the scientific work of The Society into appropriate sections, and organize such councilor district societies composed of members of component societies, as will promote the interests of the profession.

Chapter VII — Councilor Districts

Section 1. To facilitate the organization of the medical profession, the State of North Carolina hereby is divided by counties into ten councilor districts as follows:

First District — Bertie-Gates-Hertford, Chowan-Perquimans, and Pasquotank-Camden-Currituck-Dare.

Second District — Beaufort-Hyde-Martin-Washington-Tyrrell, Carteret, Craven-Pamlico-Jones, Lenoir-Greene and Pitt.

Third District — Bladen, Brunswick, Columbus, Duplin, New Hanover-Pender, Onslow and Sampson.

Fourth District — Edgecombe, Halifax, Johnston, Nash, Northampton, Warren, Wayne, and Wilson.

Fifth District — Cumberland, Harnett, Hoke, Lee, Moore, Richmond, Robeson, and Scotland.

Sixth District — Alamance-Caswell, Chatham, Durham-Orange, Franklin, Granville, Person, Vance, and Wake.

Seventh District — Anson, Cabarrus, Cleveland, Gaston, Lincoln, Mecklenburg, Montgomery, Rutherford, Stanley, and Union.

Eighth District — Alleghany, Ashe, Forsyth-Stokes-Davie, Guilford, Randolph, Rockingham, Surry-Yadkin, and Wilkes.

Ninth District — Alexander, Avery, Burke, Caldwell, Catawba, Davidson, Iredell, McDowell, Rowan, and Watauga.

Tenth District — Buncombe, Cherokee, Graham, Haywood, Henderson, Jackson, Macon-Clay, Madison, Mitchell-Yancey, Polk, Swain, and Transylvania.

Now America's oldest professional liability insurer has come to North Carolina.

The newest professional liability insurer in North Carolina is the oldest in the nation. The Medical Protective Company pioneered the concept of professional protection before the turn of the century and has been serving doctors exclusively ever since. Through good times and bad.

With the current liability crisis escalating, you need to take a close look at your coverage and the company that stands behind it. Then take a close look at us. You'll see we carry the highest

rating from A.M. Best, the firm that tracks the financial stability of insurance companies nationwide. Beyond that, you'll find complete protection at premium rates that are likely lower than you're currently paying. Plus the personal attention and claims prevention assistance you deserve.

Contact Stu Mitchelson today at 704/541-8020. He's the oldest company's representative in its newest state. And he's here to serve you.

**THE
MEDICAL PROTECTIVE COMPANY**

FORT WAYNE, INDIANA

Stuart Mitchelson, P.O. Box 13489
Charlotte, North Carolina 28211, (704) 541-8020

**Let's get to the "heart" of the matter.
You want a "No Risk" System for your practice, and Med-Care has it!**

Med-Care is the powerful office management system created for medical practices and clinics. Med-Care will improve the efficiency and productivity of managing and processing patient information while *improving cash flow*. In short, it will help you manage virtually every aspect of your practice.

The Med-Care System automates labor intensive functions like insurance processing, accounts receivable, billing, appointment scheduling and even routine correspondence. Med-Care has alternate fee schedules to help speed up your patient processing. HMOs and other PHP plans are handled with ease. It is also an invaluable business analysis tool, providing the insight you need to make well-informed decisions about the performance and future growth of your practice.

But what you'll appreciate most about The Med-Care System is its simplicity. A basic knowledge of bookkeeping, billing, and insurance claim procedures is all the experience you need.

A Complete Management System Designed in Cooperation with Medical Professionals.

The reason for The Med-Care System's superior performance and simple operation is that we designed it in cooperation with the medical industry, not just systems programmers, but physicians, medical accountants and medical office managers — people with the real knowledge and understanding of medical office management.

Unless you have an insight into computers and software, selecting the right system as well as the proper support and training can be a difficult, time-consuming and very expensive experience. To make things easier on you, The Med-Care System was developed as a complete system. Everything you need — software, hardware, training and support — is included.

The Med-Care System comes complete with the Medical Office Management Program, Texas Instruments Micro or Mini System Computer with multiple work stations, printers and high capacity disk drives. Each system is tailored to the specific needs of your practice. And as your practice grows, Med-Care is flexible enough to grow with you.

The Texas Instruments Computers are expandable and support up to 128 workstations with the ability to expand storage as it is needed. They were selected for their price-performance and reliability in group practice environments.

Every Aspect of Your Practice Will Run More Efficiently.

Med-Care software is so versatile, you can tailor it to every management function in your practice. And even if you've never used a computer before, automating your practice with The Med-Care System is simple.

Med-Care's one-time data entry function is another time-saving feature. Because it's totally interactive throughout, you never need to enter the same data more than once.

Here are some of the ways Med-Care can improve the way you manage your practice:

- Eliminates paperwork by generating daily charge tickets and appointments.
- Increases cash flow by printing statements, medical reminders and collection letters.
- Improves patient service by providing instant access to each patient's medical records.
- Reduces paperwork by generating daily, monthly, or yearly receipt and charge reports by doctor, by procedure and by practice.

Med-Care's Person-To-Person Training: A Nice Way To Get Started.

Before you invest in a medical office management system, it's important to know what you're getting for your money. With The Med-Care System, what you get is more than hardware and software. You get the personal care and attention that has become a trademark of the people at Med-Care.

The moment your system arrives, the people at Med-Care will be there to guarantee a smooth, trouble-free start-up. They'll take you through an informative five-day practice clinic to ensure that everyone feels comfortable and confident with the new system. It's a nice way to get started.

But that's only the beginning. The people at Med-Care help you throughout the year. Our qualified customer service staff is specially trained on the Med-Care System. If you ever have trouble, they'll respond immediately.

We'd like to show you how simple it is to put Med-Care to work for your practice.

In just 30 minutes the system can be demonstrated at no cost or obligation to you. You'll get to see firsthand how The Med-Care System has helped many practices like yours to improve cash flow, increase productivity, and most importantly, improve the overall management of their patients.

All of these things are why Med-Care is the "No Risk" medical practice system for you.

THE FUTURE IS NOW WITH THE ELIMINATOR

"Eliminator" is a fairly harsh word to describe an x-ray generator. However, the Compu-mAs system from Bennett X-Ray Corp. and B & B X-Ray does so many things for you, there's no other word to explain it. The generator automatically calculates the next available mAs from the 34 time stations and the 7 mA stations, therefore eliminating many of the steps that were once necessary in taking x-rays.

The Compu-mAs:

- Eliminates setting major and minor kVp tap switches
- Eliminates setting high and low range for kV selectors
- Eliminates calculating mA x time to find mAs
- Eliminates checking and adjusting line compensation
- Eliminates the need to set both mA and time

By eliminating all of these steps, the Eliminator moves into the future without sacrificing dependability and accuracy. Dependability has been a benefit of owning a Bennett Radiographic System for over 30 years. And now, by automatically selecting the next available mAs combination of mA and time, Compu-mAs provides accuracy to almost infinite resolution. The Compu-mAs Eliminator—just another way B & B X-Ray is working for your end result, optimum quality radiographs.

B & B X RAY

working for the and result—optimum quality radiographs

STUDENT MEMBERSHIP

By authority of the Executive Council, a medical student membership is provided. This class of membership expires immediately upon completion of training in a recognized school of medicine located in North Carolina. Residents of North Carolina enrolled in a recognized school of medicine in another state are eligible for such membership.

BOWMAN GRAY SCHOOL OF MEDICINE

OFFICERS — **President:** Doreen L. Hughes
Secretary: Ann B. Brown

Alphabetical List of Members

Fifty Year Club

The House of Delegates of the North Carolina Medical in May of 1953, authorized the Executive Council of the Society to establish a special recognition for those physicians residing in the State of North Carolina who were members currently of the State Medical Society, who had established legal practice of medicine and who had actively practiced medicine during their life time for a period of fifty years,

Listed below in alphabetical order are the names and addresses of those physicians who resided in North Carolina and whom the North Carolina Medical Society has recognized as members of the FIFTY YEAR CLUB of the State Medical Society. This list will be added to from year to year and likewise subtracted from as losses to this club group are sustained and reckoned.

The listing for 1987 only may include Fifty Year Club members who have passed away since their recognition. The list for other years will include only those members surviving.

Dx: recurrent herpes labialis

"HERPECIN-L is my **treatment of choice** for perioral herpes." GP, NY

"HERPECIN-L appears to actually **prevent** the blisters . . . used **soon enough**." DDS, MN

"HERPECIN-L . . . a **conservative approach** with **low risk/high benefits**." MD, FL

"Used at **prodromal symptoms** . . . blisters **never formed** . . . remarkable." DH, MA

"(In clinical trials) . . . **response was dramatic**. **HERPECIN-L** . . . **proven far superior**." DDS, PA

"All patients claimed **shorter duration** . . . at **prodromal symptoms** . . . **HERPECIN-L averted** the attacks." MD, AK

OTC. See P.D.R. for information. For samples to make your own clinical evaluation, write: CAMPBELL LABORATORIES, INC., P.O. BOX 812-MD, FDR STATION, NEW YORK, N.Y. 10150

In North Carolina HERPECIN-L is available at all Crown, Eckerd, Kerr, Mutual Drug, Revco and RiteAid and other select pharmacies.

Now paying 10.94%.

U.S. Savings Bonds now pay like money market accounts! At the current rate—10.94%—you could double your money in less than seven years. Just hold Bonds for five years and you get the new higher variable rates. Plus, you get a guaranteed return. That's the kind of change anyone can appreciate.

But some of the best things about Bonds haven't changed. Savings Bonds are still as safe as ever. They're still exempt from state and local income taxes. And since Bonds cost as little as \$25, they're as affordable as ever. What's more, Bonds remain a great way to keep our country strong.

You can purchase Bonds almost anywhere. At neighborhood banks, savings and loans and credit unions. Or easier still, right through the Payroll Savings Plan where you work.

For your free booklet, write: "50 Q&A," U.S. Savings Bonds Division, Washington, DC 20226.

U.S. SAVINGS BONDS
Paying Better Than Ever

Variable rates apply to Bonds purchased on and after 11/1/82 and held at least 5 years. Bonds purchased before 11/1/82 earn variable rates when held beyond 10/31/87. Bonds held less than 5 years earn lower interest.

LIBRIUM®

chlordiazepoxide HCl/Roche

5-mg, 10-mg, 25-mg capsules

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Management of anxiety disorders; short-term relief of anxiety symptoms, acute alcohol withdrawal symptoms, preoperative apprehension and anxiety. Usually not required for anxiety or tension associated with stress of everyday life. Efficacy beyond four months not established by systematic clinical studies. Periodic reassessment of therapy recommended.

Contraindications: Known hypersensitivity to the drug.

Warnings: Warn patients that mental and/or physical abilities required for tasks such as driving or operating machinery may be impaired, as may be mental alertness in children, and that concomitant use with alcohol or CNS depressants may have an additive effect. Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage. Withdrawal symptoms (including convulsions) reported after abrupt cessation of extended use of excessive doses are similar to those seen with barbiturates. Milder symptoms reported infrequently when continuous therapy is abruptly ended. Avoid abrupt discontinuation; gradually taper dosage.

Usage in Pregnancy: Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants, causal relationship has not been established clinically. Due to isolated reports of exacerbation, use with caution in patients with porphyria.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment, blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for maximum beneficial effects. Oral—Adults: Mild and moderate anxiety disorders and symptoms, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients, 5 mg b.i.d. to q.i.d. (See Precautions).

Supplied: Librium® (chlordiazepoxide HCl/Roche) Capsules, 5 mg, 10 mg and 25 mg—bottles of 100 and 500; Tel-E-Dose® packages of 100, available in boxes of 4 reverse-numbered cards of 25, and in boxes containing 10 strips of 10 Libritabs® (chlordiazepoxide/Roche) Tablets, 5 mg and 10 mg—bottles of 100 and 500; 25 mg—bottles of 100. With respect to clinical activity, capsules and tablets are indistinguishable.

“An investment in knowledge pays the best interest.”

Your Government has published thousands of books to serve America. And now the Government Printing Office has put together a catalog of the Government's "Bestsellers"—almost a thousand books in all. Books like *The Space Shuttle at Work*, *Starting a Business*, *U.S. Postage Stamps*, and *National Parks Guide and Map*. I daresay there's even information on one of my favorite subjects—printing.

Find out what the Government has published for you—send for your free catalog. Write—

New Catalog

Post Office Box 37000
Washington, D.C. 20013

Before prescribing, see complete prescribing information in SK&F CO. literature or PDR. The following is a brief summary.

WARNING

This drug is not indicated for initial therapy of edema or hypertension. Edema or hypertension requires therapy titrated to the individual. If this combination represents the dosage so determined, its use may be more convenient in patient management. Treatment of hypertension and edema is not static, but must be reevaluated as conditions in each patient warrant.

Contraindications: Concomitant use with other potassium-sparing agents such as spironolactone or amiloride. Further use in anuria, progressive renal or hepatic dysfunction, hyperkalemia. Pre-existing elevated serum potassium. Hypersensitivity to either component or other sulfonamide-derived drugs.

Warnings: Do not use potassium supplements, dietary or otherwise, unless hypokalemia develops or dietary intake of potassium is markedly impaired. If supplementary potassium is needed, potassium tablets should not be used. Hyperkalemia can occur, and has been associated with cardiac irregularities. It is more likely in the severely ill, with urine volume less than one liter/day, the elderly and diabetics with suspected or confirmed renal insufficiency. Periodically, serum K⁺ levels should be determined. If hyperkalemia develops, substitute a thiazide alone, restrict K⁺ intake. Associated widened QRS complex or arrhythmia requires prompt additional therapy. Thiazides cross the placental barrier and appear in cord blood. Use in pregnancy requires weighing anticipated benefits against possible hazards, including fetal or neonatal jaundice, thrombocytopenia, other adverse reactions seen in adults. Thiazides appear and triamterene may appear in breast milk. If their use is essential, the patient should stop nursing. Adequate information on use in children is not available. Sensitivity reactions may occur in patients with or without a history of allergy or bronchial asthma. Possible exacerbation or activation of systemic lupus erythematosus has been reported with thiazide diuretics.

Precautions: The bioavailability of the hydrochlorothiazide component of 'Dyazide' is about 50% of the bioavailability of the single entity. Theoretically, a patient transferred from the single entities of triamterene and hydrochlorothiazide may show an increase in blood pressure or fluid retention. Similarly, it is also possible that the lesser hydrochlorothiazide bioavailability could lead to increased serum potassium levels. However, extensive clinical experience with 'Dyazide' suggests that these conditions have not been commonly observed in clinical practice. Angiotensin-converting enzyme (ACE) inhibitors can elevate serum potassium; use with caution with 'Dyazide'. Do periodic serum electrolyte determinations (particularly important in patients vomiting excessively or receiving parenteral fluids, and during concurrent use with amphotericin B or corticosteroids or corticotropin (ACTH)). Periodic BUN and serum creatinine determinations should be made, especially in the elderly, diabetics or those with suspected or confirmed renal insufficiency. Cumulative effects of the drug may develop in patients with impaired renal function. Thiazides should be used with caution in patients with impaired hepatic function. They can precipitate coma in patients with severe liver disease. Observe regularly for possible blood dyscrasias, liver damage, other idiosyncratic reactions. Blood dyscrasias have been reported in patients receiving triamterene, and leukopenia, thrombocytopenia, agranulocytosis, and aplastic and hemolytic anemia have been reported with thiazides. Thiazides may cause manifestation of latent diabetes mellitus. The effects of oral anticoagulants may be decreased when used concurrently with hydrochlorothiazide; dosage adjustments may be necessary. Clinically insignificant reductions in arterial responsiveness to norepinephrine have been reported. Thiazides have also been shown to increase the paralyzing effect of nondepolarizing muscle relaxants such as tubocurarine. Triamterene is a weak folic acid antagonist. Do periodic blood studies in cirrhotics with splenomegaly. Antihypertensive effects may be enhanced in post-sympathectomy patients. Use cautiously in surgical patients. Triamterene has been found in renal stones in association with the other usual calculus components. Therefore, 'Dyazide' should be used with caution in patients with histories of stone formation. A few occurrences of acute renal failure have been reported in patients on 'Dyazide' when treated with indomethacin. Therefore, caution is advised in administering nonsteroidal anti-inflammatory agents with 'Dyazide'. The following may occur: transient elevated BUN or creatinine or both, hyperglycemia and glycosuria (diabetic insulin requirements may be altered), hyperuricemia and gout, digitalis intoxication (in hypokalemia), decreasing alkali reserve with possible metabolic acidosis. 'Dyazide' interferes with fluorescent measurement of quinidine. Hypokalemia is uncommon with 'Dyazide', but should it develop, corrective measures should be taken such as potassium supplementation or increased dietary intake of potassium-rich foods. Corrective measures should be instituted cautiously and serum potassium levels determined. Discontinue corrective measures and 'Dyazide' should laboratory values reveal elevated serum potassium. Chloride deficit may occur as well as dilutional hyponatremia. Concurrent use with chlorpropamide may increase the risk of severe hyponatremia. Serum PBI levels may decrease without signs of thyroid disturbance. Calcium excretion is decreased by thiazides. 'Dyazide' should be withdrawn before conducting tests for parathyroid function. Thiazides may add to or potentiate the action of other antihypertensive drugs. Diuretics reduce renal clearance of lithium and increase the risk of lithium toxicity.

Adverse Reactions: Muscle cramps, weakness, dizziness, headache, dry mouth, anaphylaxis, rash, urticaria, photosensitivity, purpura, other dermatological conditions, nausea and vomiting, diarrhea, constipation, other gastrointestinal disturbances; postural hypotension (may be aggravated by alcohol, barbiturates, or narcotics). Necrotizing vasculitis, paresthesias, icterus, pancreatitis, xanthopsia and respiratory distress including pneumonitis and pulmonary edema, transient blurred vision, sialadenitis, and vertigo have occurred with thiazides alone. Triamterene has been found in renal stones in association with other usual calculus components. Rare incidents of acute interstitial nephritis have been reported. Impotence has been reported in a few patients on 'Dyazide', although a causal relationship has not been established.

Supplied: 'Dyazide' is supplied as a red and white capsule, in bottles of 1000 capsules; Single Unit Packages (unit-dose) of 100 (intended for institutional use only); in Patient-Pak™ unit-of-use bottles of 100.

A BETTER CHANCE FOR **AN ULCER—**

Well-controlled clinical trials confirm:
ZANTAC 150 mg h.s. significantly superior to
cimetidine 400 mg h.s. for maintenance therapy
in healed duodenal ulcers.

FREE FUTURE

Percent of patients ulcer-free after 1 year of therapy

ZANTAC

150 mg h.s. (n = 60)

84%*

cimetidine

400 mg h.s. (n = 66)

57%

ZANTAC

150 mg h.s. (n = 243)

77%†

cimetidine

400 mg h.s. (n = 241)

63%

All patients were permitted pro antacids for relief of pain.
Adapted from Silvis¹ and Gough.²

These two trials^{1,2} used the currently recommended dosing regimen of cimetidine (400 mg h.s.) and ranitidine (150 mg h.s.). A comparison of other dosing regimens has not been studied.

The studied dosing regimens are not equivalent with respect to the degree and duration of acid suppression or suppression of nocturnal acid.

The superiority of ranitidine over cimetidine in these trials indicates that the dosing regimen currently recommended for cimetidine is less likely to be as successful in maintenance therapy.

ZANTAC® 150 Tablets
(ranitidine hydrochloride)
ZANTAC® 300 Tablets
(ranitidine hydrochloride)

**BRIEF SUMMARY OF
PRODUCT INFORMATION**

The following is a brief summary only. Before prescribing, see complete prescribing information in ZANTAC® product labeling.

INDICATIONS AND USAGE: ZANTAC® is indicated in:

1. Short-term treatment of **active duodenal ulcer**. Most patients heal within four weeks.
2. **Maintenance therapy** for duodenal ulcer patients at reduced dosage after healing of acute ulcers.
3. The treatment of **pathological hypersecretory conditions** (eg, Zollinger-Ellison syndrome and systemic mastocytosis).
4. Short-term treatment of **active, benign gastric ulcer**. Most patients heal within six weeks and the usefulness of further treatment has not been demonstrated.
5. Treatment of **gastroesophageal reflux disease (GERD)**. Symptomatic relief commonly occurs within one or two weeks after starting therapy and is maintained throughout a six-week course of therapy.

In active duodenal ulcer; active, benign gastric ulcer; hypersecretory states; and GERD, concomitant antacids should be given as needed for relief of pain.

CONTRAINDICATIONS: ZANTAC® is contraindicated for patients known to have hypersensitivity to the drug.

PRECAUTIONS: Symptomatic response to ZANTAC® therapy does not preclude the presence of gastric malignancy.

Since ZANTAC is excreted primarily by the kidney, dosage should be adjusted in patients with impaired renal function (see **DOSAGE AND ADMINISTRATION**). Caution should be observed in patients with hepatic dysfunction since ZANTAC is metabolized in the liver.

False-positive tests for urine protein with Multistix® may occur during ZANTAC therapy, and therefore testing with sulfosalicylic acid is recommended.

Although recommended doses of ZANTAC do not inhibit the action of cytochrome P-450 enzymes in the liver, there have been isolated reports of drug interactions which suggest that ZANTAC may affect the bioavailability of certain drugs by some mechanism as yet unidentified (eg, a pH-dependent effect on absorption or a change in volume of distribution).

Lack of experience to date precludes recommending ZANTAC for use in children or pregnant patients. Since ZANTAC is secreted in human milk, caution should be exercised when administered to a nursing mother.

ADVERSE REACTIONS: Headache, sometimes severe, seems to be related to ZANTAC® administration. Constipation, diarrhea, nausea/vomiting, and abdominal discomfort/pain have been reported. There have been rare reports of malaise, dizziness, somnolence, insomnia, vertigo, tachycardia, bradycardia, premature ventricular beats, and orthralgias. Rare cases of reversible mental confusion, agitation, depression, and hallucinations have been reported, predominantly in severely ill elderly patients.

In normal volunteers, SGPT values were increased to at least twice the pretreatment levels in 6 of 12 subjects receiving 100 mg qid IV for seven days, and in 4 of 24 subjects receiving 50 mg qid for five days. With oral administration there have been occasional reports of reversible hepatitis, hepatocellular or hepatocolic or mixed, with or without jaundice.

There have been rare reports of reversible leukopenia, granulocytopenia, thrombocytopenia, and pancytopenia.

Although controlled studies have shown no antiondrogenic activity, occasional cases of gynecostasia, impotence, and loss of libido have been reported in male patients receiving ZANTAC, but the incidence did not differ from that in the general population.

Incidents of rash, including rare cases suggestive of mild erythema multiforme, and, rarely, alopecia, have been reported, as well as rare cases of hypersensitivity reactions (eg, bronchospasm, fever, rash, eosinophilia) and small increases in serum creatinine.

OVERDOSAGE: Information concerning possible overdosage and its treatment appears in the full prescribing information.

DOSAGE AND ADMINISTRATION: Active Duodenal Ulcer: The current recommended adult oral dosage is 150 mg twice daily. An alternate dosage of 300 mg once daily at bedtime can be used for patients in whom dosing convenience is important. The advantages of one treatment regimen compared to the other in a particular patient population have yet to be demonstrated.

Maintenance Therapy: The current recommended adult oral dosage is 150 mg at bedtime.

Pathological Hypersecretory Conditions (such as Zollinger-Ellison Syndrome): The current recommended adult oral dosage is 150 mg twice a day. In some patients it may be necessary to administer ZANTAC 150-mg doses more frequently. Doses should be adjusted to individual patient needs, and should continue as long as clinically indicated. Doses up to 6 g/day have been employed in patients with severe disease.

Benign Gastric Ulcer: The current recommended adult oral dosage is 150 mg twice a day.

GERD: The current recommended adult oral dosage is 150 mg twice a day.

Dosage Adjustment for Patients with Impaired Renal Function: On the basis of experience with a group of subjects with severely impaired renal function treated with ZANTAC, the recommended dosage in patients with a creatinine clearance less than 50 ml/min is 150 mg every 24 hours. Should the patient's condition require, the frequency of dosing may be increased to every 12 hours or even further with caution. Hemodialysis reduces the level of circulating ranitidine. Ideally, the dosage schedule should be adjusted so that the timing of a scheduled dose coincides with the end of hemodialysis.

HOW SUPPLIED: ZANTAC® 300 Tablets (ranitidine hydrochloride equivalent to 300 mg of ranitidine) are yellow, capsule-shaped tablets embossed with "ZANTAC 300" on one side and "Glaxo" on the other. They are available in bottles of 30 (NDC 0173-0393-40) and unit dose packs of 100 tablets (NDC 0173-0393-47).

ZANTAC® 150 Tablets (ranitidine hydrochloride equivalent to 150 mg of ranitidine) are white tablets embossed with "ZANTAC 150" on one side and "Glaxo" on the other. They are available in bottles of 60 tablets (NDC 0173-0344-42) and unit dose packs of 100 tablets (NDC 0173-0344-47).

Store between 15° and 30° C (59° and 86° F) in a dry place. Protect from light. Replace cap securely after each opening.

PHYSICIANS, SCHEDULE SOME TIME FOR YOUR COUNTRY.

Many physicians would like to devote some time to their country in a local Army Reserve unit. We know that making a weekend commitment can be difficult for most physicians. So it is practical for the Army Reserve units to be flexible about time. It's worth discussing.

Incidentally, in addition to satisfying your own desire to serve your country, there are exceptional opportunities to do something totally different from a day-to-day routine. Opportunities to study new areas of medicine, meet new people in your specialty, and be a part of one of the world's most advanced medical teams.

Discuss the opportunities with our Army Medical Personnel Counselor.

FOR SURGEONS LOOKING FOR A CHALLENGE.

Your challenge could be the Army Reserve unit near you. It's a unit that requires the services of surgeons.

You may wish to explore the challenge of teaching in a major medical center. You may wish to explore the special challenges of your specialty in triage. Certainly you'll be confronted by challenges very different from your daily routine.

You'll also have an opportunity to participate in a number of programs in which you'll be able to exchange views and information with other surgeons from all over the country.

The Army Reserve understands the time demands on a busy physician, so you can count on us to be totally flexible in making time for you to share your specialty with your country. We'll arrange your training program to work with your practice.

To find out about the benefits of serving with a nearby Army Reserve unit, we recommend you call our Army Medical Personnel Counselor.

PHYSICIANS, THERE ARE TWO KINDS OF FLEXIBILITY IN THE ARMY RESERVE WE THINK YOU'LL LIKE.

One, time. We know how tough it is for a busy physician to make weekend time commitments. So we offer flexible training programs that allow a physician to share some time with his or her country. We arrange a schedule to suit your requirements.

Two, the opportunity to explore other phases of medicine, to add a different kind of knowledge—the challenge of military health care. It's a flexibility which could prove to be both stimulating and rewarding, with the opportunity to participate in a variety of programs that can put you in contact with medical leaders from all over the country.

See how flexible we can be, call our Army Medical Personnel Counselor.

**ARMY RESERVE.
BE ALL YOU CAN BE.**

HERE'S ONE DOCTOR WHO WON'T PAY HIS MALPRACTICE PREMIUMS THIS YEAR.

The Army covers his premiums. Since he's an Army Physician, there are a lot of worries associated with private practice that he won't have to contend with. Like excessive paperwork, and the overhead costs incurred in running a private practice.

What he will get is a highly challenging, highly rewarding experience. The Army offers varied assignments, chances to specialize, or further your education, and to work with a team of dedicated health care professionals. Plus a generous benefits package.

If you're interested in practicing high quality health care with a minimum of administrative burdens, examine Army medicine. Talk to your local Army Medical Department Counselor for more information.

**ARMY MEDICINE.
BE ALL YOU CAN BE.**

Ceclor[®]
cefactor

250-mg Pulvules[®] t.i.d.

**offers effectiveness against
the major causes of bacterial bronchitis**

Haemophilus influenzae, Streptococcus pneumoniae
(ampicillin-susceptible and ampicillin-resistant)

Note: Ceclor is contraindicated in patients with known allergy to the cephalosporins and should be given cautiously to penicillin-allergic patients.

Penicillin is the usual drug of choice in the treatment and prevention of streptococcal infections, including the prophylaxis of rheumatic fever. See prescribing information.

Ceclor[®] (cefactor)

Summary. Consult the package literature for prescribing information.

Indications: Lower respiratory infections, including pneumonia, caused by susceptible strains of *Streptococcus pneumoniae*, *Haemophilus influenzae*, and *Streptococcus pyogenes* (group A β -hemolytic streptococci).

Contraindication:
Known allergy to cephalosporins.

Warnings:
CECLOR SHOULD BE ADMINISTERED CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. PENICILLINS AND CEPHALOSPORINS SHOW PARTIAL CROSS-ALLERGENICITY. POSSIBLE REACTIONS INCLUDE ANAPHYLAXIS.

Administer cautiously to allergic patients. Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics. It must be considered in differential diagnosis of antibiotic-associated diarrhea. Colon flora is altered by broad-spectrum antibiotic treatment, possibly resulting in antibiotic-associated colitis.

Precautions:

- Discontinue Ceclor in the event of allergic reactions to it.
- Prolonged use may result in overgrowth of nonsusceptible organisms.
- Positive direct Coombs' tests have been reported during treatment with cephalosporins.
- Ceclor should be administered with caution in the presence of markedly impaired renal function. Although dosage adjustments in moderate to severe renal impairment are usually not required, careful clinical observation and laboratory studies should be made.
- Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.
- Safety and effectiveness have not been determined in pregnancy, lactation, and infants less than one month old. Ceclor penetrates mother's milk. Exercise caution in prescribing for these patients.

Adverse Reactions: (percentage of patients)

Therapy-related adverse reactions are uncommon. Those reported include:

- Gastrointestinal (mostly diarrhea): 2.5%.
- Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment.
- Hypersensitivity reactions (including morbilliform eruptions, pruritus, urticaria, and serum-sickness-like reactions that have included erythema multiforme [rarely, Stevens-Johnson syndrome] or the above skin manifestations accompanied by arthritis/arthralgia and, frequently, fever): 1.5%; usually subside within a few days after cessation of therapy. Serum-sickness-like reactions have been reported more frequently in children than in adults and have usually occurred during or following a second course of therapy with Ceclor. No serious sequelae have been reported. Antihistamines and corticosteroids appear to enhance resolution of the syndrome.
- Cases of anaphylaxis have been reported, half of which have occurred in patients with a history of penicillin allergy.
- As with some penicillins and some other cephalosporins, transient hepatitis and cholestatic jaundice have been reported rarely.
- Rarely, reversible hyperactivity, nervousness,

insomnia, confusion, hypertonia, dizziness, and somnolence have been reported.

- Other: eosinophilia, 2%; genital pruritus or vaginitis, less than 1%; and, rarely, thrombocytopenia.

Abnormalities in laboratory results of uncertain etiology

- Slight elevations in hepatic enzymes.
- Transient fluctuations in leukocyte count (especially in infants and children).
- Abnormal urinalysis; elevations in BUN or serum creatinine.
- Positive direct Coombs' test.
- False-positive tests for urinary glucose with Benedict's or Fehling's solution and Clinistix[®] tablets but not with Tes-Tape[®] (glucose enzymatic test strip, Lilly).

**Depressed and anxious,
she's sitting out life
instead of living it**

From "looking"..

to "living"..

FOR FAST RELIEF OF MODERATE DEPRESSION AND ANXIETY

See the difference in the first week

Limbitrol[®] Limbitrol DS[®]

Each tablet contains 5 mg. chloralhydrate and 12.5 mg. clonidine (as the hydrochloride salt).

Each tablet contains 16 mg. chloralhydrate and 25 mg. clonidine (as the hydrochloride salt).

PROTECT YOUR DECISION. WRITE "DO NOT SUBSTITUTE"

Prescription only. For information, call 1-800-441-4444.

FROM LOOKING...TO LIVING...

to smiling again!

The rewards of Limbitrol

In moderate depression and anxiety:

- Rapid results—62% of total four-week improvement within a week versus 44% with amitriptyline¹
- Earlier relief of associated somatic complaints²
- Fewer dropouts due to side effects—only 1/3 the rate of those patients taking amitriptyline, although the incidence of side effects is comparable¹
- Fast improvement with less amitriptyline—1/3 to 1/2 the dose of patients taking amitriptyline alone³

Caution patients about the combined effects of Limbitrol with alcohol or other CNS depressants and about activities requiring complete mental alertness, such as operating machinery or driving a car. In general, limit dosage to the lowest effective amount in elderly patients.

SEE THE DIFFERENCE IN THE FIRST WEEK¹

Limbitrol[®]

Each tablet contains 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt) ^{IV}

Limbitrol[®] DS

Each tablet contains 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt) ^{IV}

Limbitrol[®] ^{IV}

Tranquilizer—Antidepressant

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Relief of moderate to severe depression associated with moderate to severe anxiety.

Contraindications: Known hypersensitivity to benzodiazepines or tricyclic antidepressants. Do not use with monoamine oxidase (MAO) inhibitors or within 14 days following discontinuation of MAO inhibitors since hyperpyretic crises, severe convulsions and deaths have occurred with concomitant use. Then initiate cautiously, gradually increasing dosage until optimal response is achieved. Contraindicated during acute recovery phase following myocardial infarction.

Warnings: Use with great care in patients with history of urinary retention or angle-closure glaucoma. Severe constipation may occur in patients taking tricyclic antidepressants and anticholinergic-type drugs. Closely supervise cardiovascular patients. (Arrhythmias, sinus tachycardia and prolongation of conduction time reported with use of tricyclic antidepressants, especially high doses. Myocardial infarction and stroke reported with use of this class of drugs.) Caution patients about possible combined effects with alcohol and other CNS depressants and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving).

Usage in Pregnancy: Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Since physical and psychological dependence to chlordiazepoxide have been reported rarely, use caution in administering Limbitrol to addiction-prone individuals or those who might increase dosage; withdrawal symptoms following discontinuation of either component alone have been reported (nausea, headache and malaise for amitriptyline, symptoms [including convulsions] similar to those of barbiturate withdrawal for chlordiazepoxide).

Precautions: Use with caution in patients with a history of seizures, in hyperthyroid patients or those on thyroid medication, and in patients with impaired renal or hepatic function. Because of the possibility of suicide in depressed patients, do not permit easy access to large quantities in these patients. Periodic liver function tests and blood counts are recommended during prolonged treatment. Amitriptyline component may block action of guanethidine or similar antihypertensives. When tricyclic antidepressants are used concomitantly with cimetidine (Tagamet), clinically significant effects have been reported involving delayed elimination and increasing steady state concentrations of the tricyclic drugs. Concomitant use of Limbitrol with other psychotropic drugs has not been evaluated; sedative effects may be additive. Discontinue several days before surgery. Limit concomitant administration of ECT to essential treatment. See Warnings for precautions about pregnancy. Limbitrol should not be taken during the nursing period. Not recommended in children under 12. In the elderly and debilitated, limit to smallest effective dosage to preclude ataxia, oversedation, confusion or anticholinergic effects.

Adverse Reactions: Most frequently reported are those associated with either component alone: drowsiness, dry mouth, constipation, blurred vision, dizziness and bloating. Less frequently occurring reactions include vivid dreams, impotence, tremor, confusion and nasal congestion. Many depressive symptoms including anorexia, fatigue, weakness, restlessness and lethargy have been reported as side effects of both Limbitrol and amitriptyline. Granulocytopenia, jaundice and hepatic dysfunction have been observed rarely.

The following list includes adverse reactions not reported with Limbitrol but requiring consideration because they have been reported with one or both components or closely related drugs:

Cardiovascular: Hypotension, hypertension, tachycardia, palpitations, myocardial infarction, arrhythmic heart block, stroke.

Psychiatric: Euphoria, apprehension, poor concentration, delusions, hallucinations, hypomania and increased or decreased libido.

Neurologic: Incoordination, ataxia, numbness, tingling and paresthesias of the extremities, extrapyramidal symptoms, syncope, changes in EEG patterns.

Anticholinergic: Disturbance of accommodation, paralytic ileus, urinary retention, dilatation of urinary tract.

Allergic: Skin rash, urticaria, photosensitization, edema of face and tongue, pruritus.

Hematologic: Bone marrow depression including agranulocytosis, eosinophilia, purpura, thrombocytopenia.

Gastrointestinal: Nausea, epigastric distress, vomiting, anorexia, stomatitis, peculiar taste, diarrhea, black tongue.

Endocrine: Testicular swelling and gynecomastia in the male, breast enlargement, galactorrhea and menstrual irregularities in the female, elevation and lowering of blood sugar levels, and syndrome of inappropriate ADH (antidiuretic hormone) secretion.

Other: Headache, weight gain or loss, increased perspiration, urinary frequency, mydriasis, jaundice, alopecia, parotid swelling.

Overdosage: Immediately hospitalize patient suspected of having taken an overdose. Treatment is symptomatic and supportive. IV administration of 1 to 3 mg physostigmine salicylate has been reported to reverse the symptoms of amitriptyline poisoning. See complete product information for manifestations and treatment.

Dosage: Individualize according to symptom severity and patient response. Reduce to smallest effective dosage when satisfactory response is obtained. Larger portion of daily dose may be taken at bedtime. Single h.s. dose may suffice for some patients. Lower dosages are recommended for the elderly. Limbitrol DS (double strength) Tablets, initial dosage of three or four tablets daily in divided doses, increased up to six tablets or decreased to two tablets daily as required. Limbitrol Tablets, initial dosage of three or four tablets daily in divided doses, for patients who do not tolerate higher doses.

How Supplied: Double strength (DS) Tablets, white, film-coated, each containing 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt), and Tablets, blue, film-coated, each containing 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt). Available in bottles of 100 and 500; Tel-E-Dose[®] packages of 100; Prescription Paks of 50.

ROCHE PRODUCTS INC.
Monro, Puerto Rico 00701

Physicians You'll get more from the Guard than you can imagine.

The moment you entered the field of medicine, you made a commitment to helping people. And they, in turn, looked to you with a trust and respect that's afforded few other professions. It was that special relationship that instilled in you a strong sense of community: an awareness of our dependence on one another and of how vital your position was. It was a proud feeling. You'll never lose it.

But you can build on it. You can experience an even greater sense of community as a member of the Army National Guard. Our whole being is based on the idea of community. And we're unique among the services because of it.

Our members aren't full-time military people. They're citizen soldiers who serve their own hometowns, cities, and states. They help their neighbors in times of crisis and their country in its times of need. And through the Guard they develop a feeling of purpose of involvement that gives their lives extra importance.

Right now, the Army National Guard *needs you*. We need your skills, your expertise, your insights. You're a valuable professional, so we recognize your need for more substantial benefits. And there are plenty of them.

But more than anything, we believe you're ready for something that'll give you an added pride and worth. Something that'll put you in touch with people as never before.

It's the chance to realize a greater sense of community. We don't believe you can find a more meaningful avocation.

A unique and
rewarding role.

Gaining a new respect among new people.

When you spend your time with us, you'll discover more than a job. You'll discover a fellowship. The Guard is a whole community of talented colleagues working together, exchanging ideas, and establishing friendships. It's a peer association you'll look forward to. One that goes beyond the usual medical organizations and societies you might belong to

because it's part of a highly charged, active military environment and has its own very distinct challenges and rewards.

Once you enter the Army National Guard, you'll be appointed a commissioned officer to a rank commensurate with your training and experience.

You'll also become eligible for one of the best retirement programs anywhere. And in this day and age, that's one nest egg that's becoming increasingly difficult to establish.

When you join the Army Guard, you give up just a small part of your time, but you get so much in return. And there's more.

The opportunity to further your education in the classroom and the field.

As a physician, the continuance of your education is vital to your personal and professional growth. You need to attend medical conferences and learn new procedures. In the Guard, you can do just that. And be paid for it.

For your annual training, you may be able to attend approved civilian medical conferences and

seminars in order to meet your continuing education requirements. It doesn't always have to be done in one block, either. The

15 days may be performed in separate increments, as planned and coordinated by the unit commander to fulfill the National Guard requirement and to accommodate your professional schedule.

There are other ways you can perform annual training. How about establishing and manning a field hospital? This comes under Site Support, and it's the kind of training that requires your unit to travel to a camp and actively practice the skills needed to meet real Army Guard emergencies. It's a lot of work, but a lot of excitement, too.

In acute and chronic edema due to CHF

FOR PREDICTABLE CONTROL

- **Less potassium loss for a given amount of sodium excretion than with furosemide^{1,3}**
- **Predictable dose response⁴**
- **Diuresis completed hours faster than with furosemide after oral dosing⁵**
- **Better GI absorption^{6,7}**
- **Early evening dosing helps prevent nocturnal dyspnea**

As with all loop diuretics, excessive doses of BUMEX can lead to profound diuresis with water and electrolyte depletion, including hypokalemia, so serum electrolytes should be monitored.

Bumex[®]

bumetanide/Roche

0.5-mg, 1-mg and 2-mg scored tablets; 2-ml ampuls and 2-ml, 4-ml and 10-ml vials (0.25 mg/ml)

BUMEX[®]
(bumetanide/Roche)
0.5-mg, 1-mg and 2-mg scored tablets
2-ml ampuls, 2-ml, 4-ml and
10-ml vials (0.25 mg/ml)
Before prescribing, please consult complete product information, a summary of which follows:

WARNING: Bumex (bumetanide/Roche) is a potent diuretic which, if given in excessive amounts, can lead to a profound diuresis with water and electrolyte depletion. Therefore, careful medical supervision is required, and dose and dosage schedule have to be adjusted to the individual patient's needs. (See under **DOSAGE AND ADMINISTRATION** in complete product information.)

INDICATIONS AND USAGE: Edema associated with congestive heart failure, hepatic and renal disease, including the nephrotic syndrome.

Almost equal diuretic response occurs after oral and parenteral administration of Bumex. If impaired gastrointestinal absorption is suspected or oral administration is not practical, Bumex should be given by the intramuscular or intravenous route.

Successful treatment with Bumex following instances of allergic reactions to furosemide suggests a lack of cross-sensitivity.

CONTRAINDICATIONS: Anuria. Hypersensitivity and in patients in hepatic coma or in states of severe electrolyte depletion. Although Bumex can be used to induce diuresis in renal insufficiency, any marked increase in blood urea nitrogen or creatinine, or the development of oliguria during therapy of patients with progressive renal disease, is an indication for discontinuation of treatment.

WARNINGS: Dose should be adjusted to patient's needs. Excessive doses or too frequent administration can lead to profound water loss, electrolyte depletion, dehydration, reduction in blood volume and circulatory collapse with the possibility of vascular thrombosis and embolism, particularly in elderly patients.

Prevention of hypokalemia requires particular attention in patients receiving digitalis and diuretics for congestive heart failure, hepatic cirrhosis and ascites, states of aldosterone excess with normal renal function, potassium-losing nephropathy, certain diarrheal states, or other states where hypokalemia is thought to represent particular added risk to the patients.

In patients with hepatic cirrhosis and ascites, sudden alterations of electrolyte balance may precipitate hepatic encephalopathy and coma. Treatment in such patients is best initiated in the hospital with small doses and careful monitoring of the patient's clinical status and electrolyte balance. Supplemental potassium and/or spironolactone may prevent hypokalemia and metabolic alkalosis in these patients. In cats, dogs and guinea pigs, Bumex has been shown to produce ototoxicity. Since Bumex is about 40 to 60 times as potent as furosemide, it is anticipated that blood levels necessary to produce ototoxicity will rarely be achieved. The potential for ototoxicity increases with intravenous therapy, especially at high doses.

Patients allergic to sulfonamides may show hypersensitivity to Bumex.

PRECAUTIONS: Measure serum potassium periodically and add potassium supplements or potassium-sparing diuretics, if necessary. Periodic determinations of other electrolytes are advised in patients treated with high doses or for prolonged periods, particularly in those on low salt diets.

Hyperuricemia may occur. Reversible elevations of the BUN and creatinine may occur, especially with dehydration and in patients with renal insufficiency. Bumex may increase urinary calcium excretion. Possibility of effect on glucose metabolism exists. Periodic determinations of blood sugar should be done, particularly in patients with diabetes or suspected latent diabetes.

Patients should be observed regularly for possible occurrence of blood dyscrasias, liver damage or idiosyncratic reactions.

Especially in presence of impaired renal function, use of parenterally administered Bumex should be avoided in patients to whom aminoglycoside antibiotics are also being given, except in life-threatening conditions.

Drugs with nephrotoxic potential and bumetanide should not be administered simultaneously. Since lithium reduces renal clearance and adds a high risk of lithium toxicity, it should not be given with diuretics.

Probenecid should not be administered concurrently with Bumex.

Concurrent therapy with indomethacin not recommended.

Bumex may potentiate the effects of antihypertensive drugs, necessitating reduction in dosage.

Interaction studies in humans have shown no effect on digoxin blood levels.

Interaction studies in humans have shown Bumex to have no effect on warfarin metabolism or on plasma prothrombin activity.

Pregnancy: Bumex should be given to a pregnant woman only if the potential benefit justifies the potential risk to the fetus.

Bumetanide may be excreted in breast milk.

Pediatric Use: Safety and effectiveness below age 18 not established.

ADVERSE REACTIONS: Muscle cramps, dizziness, hypotension, headache and nausea, and encephalopathy (in patients with preexisting liver disease).

Less frequent clinical adverse reactions are weakness, impaired hearing, rash, pruritus, hives, electrocardiogram changes, abdominal pain, arthritic pain, musculoskeletal pain and vomiting. Other clinical adverse reactions are vertigo, chest pain, ear discomfort, fatigue, dehydration, sweating, hyperventilation, dry mouth, upset stomach, renal failure, asthenia, itching, nipple tenderness, diarrhea, premature ejaculation and difficulty maintaining an erection.

Laboratory abnormalities reported are hyperuricemia, azotemia, hyperglycemia, increased serum creatinine, hypochloremia, hypokalemia, hyponatremia, and variations in CO₂ content, bicarbonate, phosphorus and calcium. Although manifestations of the pharmacologic action of Bumex, these conditions may become more pronounced by intensive therapy.

Diuresis induced by Bumex may also rarely be accompanied by changes in LOH, total serum bilirubin, serum proteins, SGOT, SGPT, alkaline phosphatase, cholesterol, creatinine clearance, deviations in hemoglobin, prothrombin time, hematocrit, platelet counts and differential counts. Increases in urinary glucose and urinary protein have also been seen.

DOSAGE AND ADMINISTRATION:

Oral Administration: The usual total daily dosage is 0.5 to 2.0 mg and in most patients is given as a single dose.

Parenteral Administration: Administer to patients (IV or IM) with GI absorption problem or who cannot take oral. The usual initial dose is 0.5 to 1 mg given over 1 to 2 minutes. If insufficient response, a second or third dose may be given at 2 to 3 hour intervals up to a maximum of 10 mg a day.

HOW SUPPLIED: Tablets, 0.5 mg (light green), 1 mg (yellow) and 2 mg (peach), bottles of 100 and 500. Prescription Packs of 30, 100, 200, 300, 400, 500, 600, 700, 800, 900, 1000. Imprint on tablets: 0.5 mg—ROCHE BUMEX 2, 1 mg—ROCHE BUMEX 1, 2 mg—ROCHE BUMEX 2.

Ampuls, 2 ml, 0.25 mg/ml, boxes of ten.

Vials, 2 ml, 4 ml and 10 ml, 0.25 mg/ml, boxes of ten.

IT JUST MAKES GOOD CENTS!

WHAT? A special cooperative group purchasing program between Dillard Healthcare Services and the North Carolina Medical Society

HOW? By saving members 10% to 25% on patient care products and office supplies used in any kind of practice. All of the state's Medical Society members are treated as one customer, but are able to receive individual deliveries on a full line of supplies. Dillard has offices in Raleigh, Charlotte, Greensboro, Winston-Salem, Wilmington and Greenville, S.C.

WHY NOT take a closer look at the product and price listing mailed to you in June? If you have any questions call your nearest Dillard branch and ask for the physician sales representative listed below

GET STARTED NOW! Save on patient-care products and office supplies. The program, which is exclusively available to NCMS members, benefits the Society as well

Who knows a physician's professional liability needs better?

Another physician, of course. That is why Medical Mutual Insurance Company of North Carolina is a physician owned and directed company. Our Board of Directors consists of 18 physicians, all members of the North Carolina Medical Society. Currently we insure approximately 80% of North Carolina's physicians and surgeons in private practice. We offer our insured physicians:

- policy limits of up to \$5,000,000 - \$7,000,000
- nationally recognized Loss Prevention Department providing on-site office audits
- experienced judicious claims service
- participation in the company through a Board of Directors elected entirely by policyholders and guaranty capital holders

CRUMPTON COMPANY.

Why do so many NC physicians participate in the Crumpton Plan of Disability Income Protection?

THE ANSWER is the 47 years of successful relationship and personal service at claim time!

Yes, the feeling of security as well as economic advantage in knowing the program is a plan of carefully designed benefits.

The plan is not filled with a lot of "purple duck feathers," but provides income when you are unable to produce — not promises, but performance.

Why not call us today to obtain the latest details for your group practice? We are delighted to offer our broadened portfolio of professional insurance.

Patients Are Now Looking Better Than Ever.

Magnetic Resonance Imaging is the most advanced diagnostic technology of the last 25 years. The quality of MRI images is helping physicians make easier, more accurate diagnoses.

Now, Craven County Hospital, in cooperation with Lenoir Memorial Hospital and Onslow Memorial Hospital, is bringing this technology to more physicians in Eastern North Carolina through MRI Ltd. The MRI unit is housed in a large van and will travel between New Bern,

Kinston, and Jacksonville.

From these sites, it will serve physicians and patients of Craven County, Lenoir Memorial, Onslow Memorial, Beaufort

County, Carteret General, Pitt Memorial, and Wayne Memorial Hospitals.

For more information or to refer patients, call Craven County Hospital at 919-633-8218 or toll free 1-800-682-0276.

Magnetic Resonance Imaging. It's helping patients look better than ever.

THE WAITING ROOM FEW PATIENTS EVER SEE.

How many meals do good doctors miss?
How many special family occasions do they
show up late for?

The sacrifices are great. But the rewards
are great too. Looking into the eyes of a wor-
ried mother and telling her that her child is
going to be fine. Helping a heart attack victim
put his life back together again.

Qualified. Committed. Caring. That's
the kind of doctor we have in the Blue Cross

and Blue Shield Personal Care Plan. That's
the kind of doctor we like to have more of.

Won't you join us? Write or call Director,
Professional Relations, Personal Care Plan,
P.O. Box 2291, Durham, North Carolina
27702. Telephone 919 489-7431.

PERSONAL CARE PLAN
Of North Carolina

A Subsidiary of Blue Cross and Blue Shield of North Carolina

To show you how many
hypertensives stayed on

INDERAL[®] LA
(PROPRANOLOL HCl)

after a major nationwide trial...

...we had
to find
just the
right room.

60,073 patients (90%) who started on INDERAL[®] LA stayed on INDERAL LA.^{1*}

Surprising? Not really.

Because most patients on INDERAL LA (propranolol HCl) don't even know it's working.

A recent double-blind, placebo-controlled, crossover study in 138 hypertensive patients² revealed that INDERAL LA has a side effects profile unsurpassed by atenolol or metoprolol — which shows how well-tolerated once-daily INDERAL LA can be.

Sole therapy or concomitant therapy?

Fifty-nine percent of the time, INDERAL LA stood on its own.

The patients in the nationwide compliance trial were no different from yours. Generally when the antihypertensive regimen is complicated, compliance may become a problem. So, the effectiveness of INDERAL LA as once-daily monotherapy is a big plus. Of the remaining hypertensives in the program, 36% were treated merely with the addition of a diuretic to INDERAL LA.

For the noncompliant patients in your practice, INDERAL LA may well be the answer.

Almost 20,000 of the patients in the nationwide compliance trial were identified as having been noncompliant with their previous antihypertensive therapy. Their physicians reported that 88% showed improved compliance when placed on once-daily INDERAL LA.

Control, comfort, and compliance

ONCE-DAILY
INDERAL[®] LA
(PROPRANOLOL HCl) LONG ACTING CAPSULES

Like conventional INDERAL Tablets, INDERAL LA should not be used in the presence of congestive heart failure, sinus bradycardia, cardiogenic shock, heart block greater than first degree, and bronchial asthma.

*After a 30-day trial with INDERAL LA, physicians reported that 90% of the patients would remain on INDERAL LA.

**The one you know best
keeps looking better**

Please see next page for brief summary of prescribing information

NEW LOW DOSE
INDERAL[®] LA 60 mg
(PROPRANOLOL HCl) LONG ACTING CAPSULES
NOW AVAILABLE...

The one you know best keeps looking better

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION SEE PACKAGE CIRCULAR)

INDERAL® LA brand of propranolol hydrochloride (Long Acting Capsules)

DESCRIPTION. Inderal LA is formulated to provide a sustained release of propranolol hydrochloride. Inderal LA is available as 60 mg, 80 mg, 120 mg, and 160 mg capsules.

CLINICAL PHARMACOLOGY. Inderal LA is a nonselective beta-adrenergic receptor-blocking agent possessing no other autonomic nervous system activity. It specifically competes with beta-adrenergic receptor-stimulating agents for available receptor sites. When access to beta-receptor sites is blocked by Inderal LA, the chronotropic, inotropic, and vasodilator responses to beta-adrenergic stimulation are decreased proportionately.

Inderal LA Capsules (60, 80, 120, and 160 mg) release propranolol HCl at a controlled and predictable rate. Peak blood levels following dosing with Inderal LA occur at about 6 hours and the apparent plasma half-life is about 10 hours. When measured at steady state over a 24-hour period the areas under the propranolol plasma concentration-time curve (AUCs) for the capsules are approximately 60% to 65% of the AUCs for a comparable divided daily dose of Inderal Tablets. The lower AUCs for the capsules are due to greater hepatic metabolism of propranolol resulting from the slower rate of absorption of propranolol. Over a twenty-four (24) hour period, blood levels are fairly constant for about twelve (12) hours then decline exponentially.

Inderal LA should not be considered a simple mg-for-mg substitute for conventional propranolol and the blood levels achieved do not match (are lower than) those of two to four times daily dosing with the same dose. When changing to Inderal LA from conventional propranolol, a possible need for retitration upwards should be considered especially to maintain effectiveness at the end of the dosing interval. In most clinical settings, however, such as hypertension or angina where there is little correlation between plasma levels and clinical effect, Inderal LA has been therapeutically equivalent to the same mg dose of conventional Inderal, as assessed by 24-hour effects on blood pressure and on 24-hour exercise responses of heart rate, systolic pressure and rate pressure product. Inderal LA can provide effective beta blockade for a 24-hour period.

INDICATIONS AND USAGE. **Hypertension:** Inderal LA is indicated in the management of hypertension. It may be used alone or used in combination with other antihypertensive agents, particularly a thiazide diuretic. Inderal LA is not indicated in the management of hypertensive emergencies.

Angina Pectoris Due to Coronary Atherosclerosis: Inderal LA is indicated for the long-term management of patients with angina pectoris.

Migraine: Inderal LA is indicated for the prophylaxis of common migraine headache. The efficacy of propranolol in the treatment of a migraine attack that has started has not been established and propranolol is not indicated for such use.

Hypertrophic Subaortic Stenosis: Inderal LA is useful in the management of hypertrophic subaortic stenosis, especially for treatment of exertional or other stress-induced angina, palpitations, and syncope. Inderal LA also improves exercise performance. The effectiveness of propranolol hydrochloride in this disease appears to be due to a reduction of the elevated outflow pressure gradient which is exacerbated by beta-receptor stimulation. Clinical improvement may be temporary.

CONTRAINDICATIONS. Inderal LA is contraindicated in 1) cardiogenic shock, 2) sinus bradycardia and greater than first-degree block, 3) bronchial asthma, 4) congestive heart failure (see WARNINGS) unless the failure is secondary to a tachyarrhythmia treatable with Inderal.

WARNINGS. **CARDIAC FAILURE.** Sympathetic stimulation may be a vital component supporting circulatory function in patients with congestive heart failure, and its inhibition by beta blockade may precipitate more severe failure. Although beta blockers should be avoided in overt congestive heart failure, if necessary, they can be used with close follow-up in patients with a history of failure who are well compensated and are receiving digitalis and diuretics. Beta-adrenergic blocking agents do not abolish the inotropic action of digitalis on heart muscle.

IN PATIENTS WITHOUT A HISTORY OF HEART FAILURE. continued use of beta blockers can, in some cases, lead to cardiac failure. Therefore, at the first sign or symptom of heart failure, the patient should be digitalized and/or treated with diuretics, and the response observed closely, or Inderal should be discontinued (gradually if possible).

IN PATIENTS WITH ANGINA PECTORIS, there have been reports of exacerbation of angina and in some cases myocardial infarction following abrupt discontinuance of Inderal therapy. Therefore, when discontinuance of Inderal is planned, the dosage should be gradually reduced over at least a few weeks, and the patient should be cautioned against interruption or cessation of therapy without the physician's advice. If Inderal therapy is interrupted and exacerbation of angina occurs, it usually is advisable to reinstitute Inderal therapy and take other measures appropriate for the management of unstable angina pectoris. Since coronary artery disease may be unrecognized, it may be prudent to follow the above advice in patients considered at risk of having occult atherosclerotic heart disease who are given propranolol for other indications.

Nonallergic Bronchospasm (eg, chronic bronchitis, emphysema) — PATIENTS WITH BRONCHOSPASTIC DISEASES SHOULD IN GENERAL NOT RECEIVE BETA BLOCKERS. Inderal should be administered with caution since it may block bronchodilation produced by endogenous and exogenous catecholamine stimulation of beta receptors.

MAJOR SURGERY. The necessity or desirability of withdrawal of beta-blocking therapy prior to major surgery is controversial. It should be noted, however, that the impaired ability of the heart to respond to reflex adrenergic stimuli may augment the risks of general anesthesia and surgical procedures.

Inderal (propranolol HCl), like other beta blockers, is a competitive inhibitor of beta-receptor agonists and its effects can be reversed by administration of such agents, eg, dobutamine or isoproterenol. However, such patients may be subject to protracted severe hypotension. Difficulty in starting and maintaining the heartbeat has also been reported with beta blockers.

DIABETES AND HYPOLYCEMIA. Beta blockers should be used with caution in diabetic patients if a beta-blocking agent is required. Beta blockers may mask tachycardia occurring with hypoglycemia, but other manifestations such as dizziness and sweating may not be significantly affected. Following insulin-induced hypoglycemia, propranolol may cause a delay in the recovery of blood glucose to normal levels.

THYROTOXICOSIS. Beta blockade may mask certain clinical signs of hyperthyroidism. Therefore, abrupt withdrawal of propranolol may be followed by an exacerbation of symptoms of hyperthyroidism including thyroid storm. Propranolol may change thyroid function tests, increasing T_4 and reverse T_3 , and decreasing T_3 .

IN PATIENTS WITH WOLFF-PARKINSON-WHITE SYNDROME, several cases have been reported in which, after propranolol, the tachycardia was replaced by a severe bradycardia requiring a demand pacemaker. In one case this resulted after an initial dose of 5 mg propranolol.

PRECAUTIONS. **GENERAL.** Propranolol should be used with caution in patients with impaired hepatic or renal function. Inderal (propranolol HCl) is not indicated for the treatment of hypertensive emergencies.

Beta-adrenoreceptor blockade can cause reduction of intraocular pressure. Patients should

be told that Inderal may interfere with the glaucoma screening test. Withdrawal may lead to a return of increased intraocular pressure.

CLINICAL LABORATORY TESTS. Elevated blood urea levels in patients with severe heart disease, elevated serum transaminase, alkaline phosphatase, lactate dehydrogenase.

DRUG INTERACTIONS. Patients receiving catecholamine-depleting drugs such as reserpine should be closely observed if Inderal is administered. The added catecholamine blocking action may produce an excessive reduction of resting sympathetic nervous activity, which may result in hypotension, marked bradycardia, vertigo, syncope, attacks, or orthostatic hypotension.

Caution should be exercised when patients receiving a beta blocker are administered a calcium-channel-blocking drug, especially intravenous verapamil, for both agents may depress myocardial contractility or atrioventricular conduction. On rare occasions, the concomitant intravenous use of a beta blocker and verapamil has resulted in serious adverse reactions, especially in patients with severe cardiomyopathy, congestive heart failure or recent myocardial infarction.

Aluminum hydroxide gel greatly reduces intestinal absorption of propranolol. Ethanol slows the rate of absorption of propranolol.

Phenitoin, phenobarbital, and rifampin accelerate propranolol clearance.

Chlorpromazine, when used concomitantly with propranolol, results in increased plasma levels of both drugs.

Antipyrene and lidocaine have reduced clearance when used concomitantly with propranolol.

Thyroxine may result in a lower than expected T_3 concentration when used concomitantly with propranolol.

Cimetidine decreases the hepatic metabolism of propranolol, delaying elimination and increasing blood levels.

Theophylline clearance is reduced when used concomitantly with propranolol.

CARCINOGENESIS, MUTAGENESIS, IMPAIRMENT OF FERTILITY. Long-term studies in animals have been conducted to evaluate toxic effects and carcinogenic potential. In 18-month studies in both rats and mice, employing doses up to 150 mg/kg/day, there was no evidence of significant drug-induced toxicity. There were no drug-related tumorigenic effects at any of the dosage levels. Reproductive studies in animals did not show any impairment of fertility that was attributable to the drug.

PREGNANCY. Pregnancy Category C. Inderal has been shown to be embryotoxic in animal studies at doses about 10 times greater than the maximum recommended human dose.

There are no adequate and well-controlled studies in pregnant women. Inderal should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

NURSING MOTHERS. Inderal is excreted in human milk. Caution should be exercised when Inderal (propranolol HCl) is administered to a nursing woman.

PEDIATRIC USE. Safety and effectiveness in children have not been established.

ADVERSE REACTIONS. Most adverse effects have been mild and transient and have rarely required the withdrawal of therapy.

Cardiovascular. Bradycardia, congestive heart failure, intensification of AV block, hypotension, paresthesia of hands, thrombocytopenic purpura, arterial insufficiency, usually of the Raynaud type.

Central Nervous System. Light-headedness, mental depression manifested by insomnia, lassitude, weakness, fatigue; reversible mental depression progressing to cataplexy; visual disturbances; hallucinations; vivid dreams, an acute reversible syndrome characterized by disorientation for time and place, short-term memory loss, emotional lability, slightly clouded sensorium, and decreased performance on neuropsychometrics. For immediate formulations, fatigue, lethargy, and vivid dreams appear dose related.

Gastrointestinal. Nausea, vomiting, epigastric distress, abdominal cramping, diarrhea, constipation, mesenteric arterial thrombosis, ischemic colitis.

Allergic. Pharyngitis and agranulocytosis, erythematous rash, fever combined with aching and sore throat, laryngospasm and respiratory distress.

Respiratory. Bronchospasm.

Hematologic. Agranulocytosis, nonthrombocytopenic purpura, thrombocytopenic purpura.

Auto-Immune. In extremely rare instances, systemic lupus erythematosus has been reported.

Miscellaneous. Alopecia, LE-like reactions, psoriasisiform rashes, dry eyes, male impotence, and Peyronie's disease have been reported rarely. Oculomucocutaneous reactions involving the skin, serous membranes and conjunctivae reported for a beta blocker (propranolol) have not been associated with propranolol.

DOSAGE AND ADMINISTRATION. Inderal LA provides propranolol hydrochloride in a sustained-release capsule for administration once daily. If patients are switched from Inderal Tablets to Inderal LA Capsules, care should be taken to assure that the desired therapeutic effect is maintained. Inderal LA should not be considered a simple mg-for-mg substitute for Inderal. Inderal LA has different kinetics and produces lower blood levels. Retitration may be necessary, especially to maintain effectiveness at the end of the 24-hour dosing interval.

HYPERTENSION — Dosage must be individualized. The usual initial dosage is 80 mg Inderal LA once daily, whether used alone or added to a diuretic. The dosage may be increased to 120 mg once daily or higher until adequate blood-pressure control is achieved. The usual maintenance dosage is 120 to 160 mg once daily. In some instances a dosage of 640 mg may be required. The time needed for full hypertensive response to a given dosage is variable and may range from a few days to several weeks.

ANGINA PECTORIS — Dosage must be individualized. Starting with 80 mg Inderal LA once daily, dosage should be gradually increased at three- to seven-day intervals until optimal response is obtained. Although individual patients may respond at any dosage level, the average optimal dosage appears to be 160 mg once daily. In angina pectoris, the value and safety of dosage exceeding 320 mg per day have not been established.

If treatment is to be discontinued, reduce dosage gradually over a period of a few weeks (see WARNINGS).

MIGRAINE — Dosage must be individualized. The initial oral dose is 80 mg Inderal LA once daily. The usual effective dose range is 160-240 mg once daily. The dosage may be increased gradually to achieve optimal migraine prophylaxis. If a satisfactory response is not obtained within four to six weeks after reaching the maximal dose, Inderal LA therapy should be discontinued. It may be advisable to withdraw the drug gradually over a period of several weeks.

HYPERTROPHIC SUBAORTIC STENOSIS — 80-160 mg Inderal LA once daily.

PEDIATRIC DOSAGE — At this time the data on the use of the drug in this age group are too limited to permit adequate directions for use.

Cutaneous Infections of the Coast

William A. Burke, M.D., and Billy E. Jones, M.D.

An infection that develops from a wound obtained in an aquatic environment should alert the physician to a variety of possible etiologic organisms not typically seen in everyday practice. Although most infections resulting from aquatic injuries are due to commonly seen organisms (such as *Staphylococcus*),¹ it is important to be aware of less common infectious agents, since some of them may have a rapidly progressive course leading to death.

The coast of North Carolina provides limitless possibilities for both recreational and commercial activities, and many diseases which are quite rare in many parts of the country actually occur quite frequently here.

Erysipelothrix rhusiopathiae

Erysipeloid is, as the name implies, an erysipelas-like infection caused by *Erysipelothrix rhusiopathiae*. This bacterium is a gram-positive pleomorphic rod which may be confused with diptheroids or *Listeria* in the laboratory. *Erysipelothrix* is widely distributed throughout the environment including fresh and salt water. In some animals, it is found as part of their normal flora; in others (e.g., swine) it may be pathogenic. Occupational groups at risk include fishermen, fish handlers, seafood processors, veterinarians, poultry workers, butchers and farmers. On our coast, erysipeloid is colloquially known as "fish poisoning," "crab poisoning," or "shrimp-pickers' disease."

Erysipelothrix can cause localized or, rarely, disseminated disease.² In localized disease, the cutaneous eruption begins several days after inoculation, most commonly on the hands. The skin lesions are usually bright red, well-demarcated plaques (figure 1, p. 423) which may burn or itch. The localized disease is unlike erysipelas in that constitutional signs and symptoms (such as fever, chills, and malaise) are usually not present.

Disseminated erysipeloid, unlike the localized form, is usually associated with fever, and blood cultures are often positive. Because endocarditis can be a serious complication,³ a careful cardiac examination is imperative. In this

form of the disease, skin lesions are not always seen, and a careful occupational/recreational history may provide an important clue to the etiology. Disseminated *Erysipelothrix* may also lead to other problems such as septic arthritis, intracranial abscess and pulmonary involvement.²

Although the organism can usually be cultured from the blood of bacteremic patients, it often loses its cell wall in tissue (to form L-forms), perhaps explaining difficulties in culturing it from skin lesions.² Diagnosis of localized infection is usually made on the basis of an appropriate clinical picture in a person at risk.

Erysipeloid, like erysipelas, is treated with penicillin, or in the penicillin-allergic patient, erythromycin. Intravenous therapy with penicillin is recommended for disseminated disease.² Although the localized form of the disease may be self-limited, antibiotic therapy is generally recommended to prevent progression of the disease into bacteremia with possible endocarditis or other sequelae.

Mycobacterium marinum

Mycobacterium marinum is one of the atypical mycobacteria, and because of its ability to produce a yellowish pigment when exposed to light, it is grouped with the photochromogens (Runyon Group 1). The bacterium is acid-fast and grows optimally at 32°C in about 7 to 14 days. Because it does not grow well at 37°C, a false-negative culture may occur if the laboratory routinely incubates cultures only at this temperature. This psychrophilia probably explains the rarity of internal dissemination seen with this organism.

Mycobacterium marinum is found in both fresh and salt water, and the cutaneous lesion is commonly called a "swimming pool granuloma" or "fish tank granuloma." The initial lesion typically begins as an erythematous papule occurring in a traumatized area (e.g., abrasion, crab bite, fish spine injury). This enlarges over three to eight weeks to a nodule which often has a verrucous appearance (figure 2, p. 423). At times, additional lesions appear along lymphatics in a sporotrichoid pattern,⁴ and, rarely, bone and joint involvement may occur.^{5,6}

A biopsy of the lesion is usually required to accurately diagnose *Mycobacterium marinum*. The tissue specimen should be submitted for both routine histology and culture.

From the Section of Dermatology, Department of Internal Medicine, East Carolina University School of Medicine, Greenville 27858-4354. Reprint requests to: William A. Burke, M.D.

Again, it is important to alert the laboratory that this organism is suspected in order to ensure that incubation is done at both 32°C and 37°C. Histopathology most commonly reveals tuberculoid granulomas with minimal caseation and sparse organisms.

Therapy of this infection may be difficult. The drug of choice in adults is minocycline (100 mg BID),⁷ although some prefer tetracycline (500 mg QID)^{8,9} or doxycycline (100 mg BID). Alternative therapies include rifampin (often combined with ethambutol) or trimethoprim-sulfamethoxazole. Because the organism prefers cooler temperatures, heat therapy (e.g., hot water soaks) may be an important adjunct to antibiotic therapy.

Therapy should be continued for several weeks after clinical improvement, since early withdrawal of antibiotics may lead to relapse. For a single localized lesion, excision, electrosurgery, or cryosurgery may be curative.

Aeromonas hydrophila

Aeromonas hydrophila is a gram-negative rod which is ubiquitous in nature and is found in both fresh and salt water. The organism was initially thought to be pathogenic only in fish, and on our coast it was thought to be the cause of "red sore" disease in striped bass. *Aeromonas* is now known to be an uncommon but sometimes serious pathogen, not only in immunocompromised patients, but also in healthy subjects. Although a self-limited cholera-like diarrhea is the most common presentation of *Aeromonas* infection, the bacterium can also cause a necrotizing cellulitis (figure 3).

As with gastrointestinal infections, most primary inoculation skin and soft tissue infections remain localized in the healthy subject. However, in immunosuppressed and agranulocytic patients, there may be rapid progression to myonecrosis, gas gangrene, and septicemia.¹⁰ Patients with leukemia and liver disease are especially at risk.¹¹ Ecthyma gangrenosum-like lesions can occur in disseminated *Aeromonas* infections.^{12,13}

Laboratory cultures of cutaneous and soft tissue infections due to this organism are often mixed (commonly with *Staphylococcus*). Although *Aeromonas hydrophila* can be grown in 12 to 24 hours on conventional media, proper laboratory identification may be missed because of biochemical similarities to the Enterobacteriaceae. Again, it becomes important to consider this unusual infection in the appropriate clinical setting and to alert the laboratory to your suspicions so that proper identification can be made. Unlike the Enterobacteriaceae, *Aeromonas hydrophila* is oxidase positive.

Initial therapy of cutaneous wound infection due to *Aeromonas* involves incision, drainage, exploration, and cleansing of affected tissue. Because many *Aeromonas* infections are mixed, trimethoprim-sulfamethoxazole is an appropriate therapy in a healthy patient, as most *Aeromonas* strains are sensitive to this drug. In an immunocompromised or bacteremic patient, imipenem-cilastatin or a third-generation

cephalosporin with an aminoglycoside are administered parenterally. The organism is also usually sensitive to the tetracyclines and chloramphenicol.^{11,14,15}

Vibrio vulnificus

Although several of the halophilic *Vibrios* (e.g., *Vibrio parahaemolyticus*, *Vibrio cholerae* non O-1, *Vibrio alginolyticus*) have been isolated from wound infections, *Vibrio vulnificus* is the most common cause of serious illness associated with *Vibrio* species in this country.^{16,17} In 1979, the bacterium received its present name,¹⁸ and since then, infections due to this organism have been recognized from a wide variety of coastal and brackish water environments including the North Carolina coast.

There are two forms of the disease: (1) primary septicemia and (2) wound infections. In patients with primary septicemia, there is often a history of eating raw seafood (usually oysters)¹⁹⁻²¹ and the infection is presumed to be acquired through the gastrointestinal tract. Hypotension with shock is a common presentation. Septicemia due to *Vibrio vulnificus* is more common in persons with underlying liver disease, blood disorders, chronic renal disease, or hemochromatosis, in patients on immunosuppressive agents, and in heavy consumers of alcohol.^{20,21} Patients with septicemia from this bacterium can display a wide variety of dermatologic manifestations including petechiae, purpura, necrotic pustules and bullous lesions (figure 4). As with *Aeromonas*, the cutaneous lesions may mimic ecthyma gangrenosum.

Mortality from septicemia with this organism is about 50%. Once again, it is imperative to consider the diagnosis in the appropriate clinical setting. Furthermore, it is important to educate patients with risk factors about the potential risks of eating raw or undercooked seafood.¹⁹⁻²¹

Penetrating injuries associated with exposure to sea water may also lead to a wound infection due to *Vibrio vulnificus*. Many patients have developed infection following lacerations that occurred while they were cleaning fish, crabs or shrimp, or shucking oysters or other shellfish. A cellulitis usually develops within one to two days following inoculation, and because of the tremendous virulence of the organism, may quickly progress to a necrotizing fasciitis, myositis or gangrene. Risk factors for internal dissemination and septicemia are similar to those for primary septicemia.

Treatment of wound infections due to *Vibrio vulnificus* includes incision, drainage and aggressive local débridement. Tetracycline is the drug of choice in the healthy patient with a mild, uncomplicated wound infection. In patients who have significant risk factors or who present with disseminated disease, parenteral tetracycline and an aminoglycoside are recommended.¹⁶ The organism is also usually responsive to chloramphenicol, the penicillins and the cephalosporins.^{16,17,22}

Figure 1. Erysiploid in a common location.

Figure 2. Verrucous lesion due to *Mycobacterium marinum* which developed after a crab bite injury.

Figure 3. Necrotizing cellulitis and myonecrosis of the thigh due to *Aeromonas hydrophila*. The patient, a coastal logger, had acute myelogenous leukemia and died from overwhelming sepsis.

Figure 4. Bullous lesion on the ankle due to *Vibrio vulnificus* septicemia in a patient with primary red cell aplasia. The patient had been "spined" on her hand by a salt water catfish two days previously.

Conclusions

It is important to re-emphasize that the majority of cutaneous infections from coastal aquatic environs are due to organisms commonly seen in everyday practice. However, the coastal environment contains its own peculiar mix of uncommon flora, some of which can produce serious disease with potentially fatal consequences if unrecognized. It is likely that with improved microbial techniques of identification and isolation of microorganisms, many "new" aquatic infections will be described in future years. ■

Now America's oldest professional liability insurer has come to North Carolina.

The newest professional liability insurer in North Carolina is the oldest in the nation. The Medical Protective Company pioneered the concept of professional protection before the turn of the century and has been serving doctors exclusively ever since. Through good times and bad.

With the current liability crisis escalating, you need to take a close look at your coverage and the company that stands behind it. Then take a close look at us. You'll see we carry the highest

rating from A.M. Best, the firm that tracks the financial stability of insurance companies nationwide. Beyond that, you'll find complete protection at premium rates that are likely lower than you're currently paying. Plus the personal attention and claims prevention assistance you deserve.

Contact Stu Mitchelson today at 704/541-8020. He's the oldest company's representative in its newest state. And he's here to serve you.

19102

MEDICAL PROTECTIVE COMPANY

FORT WAYNE, INDIANA

Stuart Mitchelson, P.O. Box 13489
Charlotte, North Carolina 28211, (704) 541-8020

*Financial services that will get
you in shape for the future.
That's Blue Chip.*

We have a variety of insurance and investment options to make sure your future is financially strong. For example:

- Tax shelters, to keep more of your money working for you;
- Annuities, to make money available at retirement or whenever you need it;
- Insurance, to protect your family, your business and your income.

Our specialists will help you identify your needs and develop a program that's right for you.

Start shaping your future today. Call or write us for details.

Nix[®] FOR LICE[®]

CREME RINSE

permethrin 1%

PEDICULICIDAL/OVICIDAL ACTIVITIES: *In vitro* data indicate that permethrin has pediculicidal and ovicidal activity against *Pediculus humanus var. capitis*. The high cure rate (97-99%) of Nix in patients with head lice demonstrated at 14 days following a single application is attributable to a combination of its pediculicidal and ovicidal activities and its residual persistence on the hair which may also prevent reinfestation.

INDICATIONS AND USAGE: Nix is indicated for the single-application treatment of infestation with *Pediculus humanus var. capitis* (the head louse) and its nits (eggs). Retreatment for recurrences is required in less than 1% of patients since the ovicidal activity may be supplemented by residual persistence in the hair. If live lice are observed after at least seven days following the initial application, a second application can be given.

CONTRAINDICATIONS: Nix is contraindicated in patients with known hypersensitivity to any of its components, to any synthetic pyrethroid or pyrethrin, or to chrysanthemums.

WARNING: If hypersensitivity to Nix occurs, discontinue use.

PRECAUTIONS:

General: Head lice infestation is often accompanied by pruritus, erythema, and edema. Treatment with Nix may temporarily exacerbate these conditions.

Information for Patients: Patients with head lice should be advised that itching, redness, or swelling of the scalp may occur after application of Nix. If irritation persists, they should consult their physician. Nix is not irritating to the eyes; however, patients should be advised to avoid contact with eyes during application and to flush with water immediately if Nix gets in the eyes. In order to prevent accidental ingestion by children, the remaining contents of Nix should be discarded after use.

Combing of nits following treatment with Nix is not necessary for effective treatment. However, patients may do so for cosmetic or other reasons. The nits are easily combed from the hair treated with Nix after drying.

Carcinogenesis, Mutagenesis, Impairment of Fertility: Six carcinogenicity bioassays were evaluated with permethrin, three each in rats and mice. No tumorigenicity was seen in the rat studies. However, species-specific increases in pulmonary adenomas, a common benign tumor of mice of high spontaneous background incidence, were seen in the three mouse studies. In one of these studies there was an increased incidence of pulmonary alveolar-cell carcinomas and benign liver adenomas only in female mice when permethrin was given in their food at a concentration of 5000 ppm. Mutagenicity assays, which give useful correlative data for interpreting results from carcinogenicity bioassays in rodents, were negative. Permethrin showed no evidence of mutagenic potential in a battery of *in vitro* and *in vivo* genetic toxicity studies.

Permethrin did not have any adverse effect on reproductive function at a dose of 180 mg/kg/day orally in a three-generation rat study.

Pregnancy: Teratogenic Effects: Pregnancy Category B. Reproduction studies have been performed in mice, rats, and rabbits (200-400 mg/kg/day orally) and have revealed no evidence of impaired fertility or harm to the fetus due to permethrin. There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Nursing Mothers: It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk and because of the evidence for tumorigenic potential of permethrin in animal studies, consideration should be given to discontinuing nursing temporarily or withholding the drug while the mother is nursing.

Pediatric Use: Nix is safe and effective in children less than two years of age. Safety and effectiveness in children less than two years of age have not been established.

ADVERSE REACTIONS: The most frequent adverse reaction to Nix is pruritus. This is usually a consequence of head lice infestation itself, but may be temporarily aggravated following treatment with Nix. 5.9% of patients in clinical studies experienced mild temporary itching; 3.4% experienced mild transient burning/stinging, tingling, numbness, or scalp discomfort, and 2.1% experienced mild transient erythema, edema, or rash of the scalp.

DOSAGE AND ADMINISTRATION:

Adults and Children: Nix is intended for use after the hair has been washed with shampoo, rinsed with water and towel dried. Apply a sufficient volume of Nix to saturate the hair and scalp. Nix should remain on the hair for 10 minutes before being rinsed off with water. A single treatment is sufficient to eliminate head lice infestation. Combing of nits is not required for therapeutic efficacy, but may be done for cosmetic or other reasons.

SHAKE WELL BEFORE USING.

HOW SUPPLIED: Nix (Permethrin) 1% (wt./wt.) Creme Rinse is supplied in plastic squeeze bottles that contain 2 fl. oz. weighing 56 g. (NDC-0081-D780-81)

Store at 15°-25°C (59°-77°F).

Our Alumni Make Great Recoveries.

They needed our program to solve their problems, so you probably won't hear them brag about their Alma Mater. But they're proud of us and we're proud of them, because they continue to live straight and sober *after* they leave our program.

Some people call it success. We call it recovery. And it happens because of teamwork. Our staff, our client's physician, employer, and family, all working together with each patient for the same goal: freedom from drugs and alcohol one day at a time.

Guaranteed. That's right, if a patient follows our program and doesn't remain drug and alcohol free, we'll provide additional treatment at *no charge*.

Don't lose your patients to alcohol and drugs. Get them back with our help and discover what recovery can mean for your patient's life.

We offer 24 hour free confidential evaluations and case consultations 7 days a week.

CARDIZEM[®] FEW SIDE EFFECTS diltiazem HCl/Marion IN ANTIANGINAL THERAPY

60 mg tid or qid

Brief Summary Professional Use Information

CARDIZEM[®]
(diltiazem HCl)
30 mg, 60 mg, 90 mg, and 120 mg Tablets

CONTRAINDICATIONS

CARDIZEM is contraindicated in (1) patients with sick sinus syndrome except in the presence of a functioning ventricular pacemaker, (2) patients with second- or third-degree AV block except in the presence of a functioning ventricular pacemaker, and (3) patients with hypotension (less than 90 mm Hg systolic).

WARNINGS

- Cardiac Conduction.** CARDIZEM prolongs AV node refractory periods without significantly prolonging sinus node recovery time, except in patients with sick sinus syndrome. This effect may rarely result in abnormally slow heart rates (particularly in patients with sick sinus syndrome) or second- or third-degree AV block (six of 1,243 patients for 0.48%). Concomitant use of diltiazem with beta-blockers or digitalis may result in additive effects on cardiac conduction. A patient with Prinzmetal's angina developed periods of asystole (2 to 5 seconds) after a single dose of 60 mg of diltiazem.
- Congestive Heart Failure.** Although diltiazem has a negative inotropic effect in isolated animal tissue preparations, hemodynamic studies in humans with normal ventricular function have not shown a reduction in cardiac index nor consistent negative effects on contractility (dp/dt). Experience with the use of CARDIZEM alone or in combination with beta-blockers in patients with impaired ventricular function is very limited. Caution should be exercised when using the drug in such patients.
- Hypotension.** Decreases in blood pressure associated with CARDIZEM therapy may occasionally result in symptomatic hypotension.
- Acute Hepatic Injury.** In rare instances, significant elevations in enzymes such as alkaline phosphatase, CPK, LDH, SGOT, SGPT, and other symptoms consistent with acute hepatic injury have been noted. These reactions have been reversible upon discontinuation of drug therapy. The relationship to CARDIZEM is uncertain in most cases, but probable in some. (See PRECAUTIONS.)

PRECAUTIONS

General. CARDIZEM (diltiazem hydrochloride) is extensively metabolized by the liver and excreted by the kidneys and in bile. As with any new drug given over prolonged periods, laboratory parameters should be monitored at regular intervals. The drug should be used with caution in patients with impaired renal or hepatic

function. In subacute and chronic dog and rat studies designed to produce toxicity, high doses of diltiazem were associated with hepatic damage. In special subacute hepatic studies, oral doses of 125 mg/kg and higher in rats were associated with histological changes in the liver which were reversible when the drug was discontinued. In dogs, doses of 20 mg/kg were also associated with hepatic changes; however, these changes were reversible with continued dosing.

Drug Interaction. Pharmacologic studies indicate that there may be additive effects in prolonging AV conduction when using beta-blockers or digitalis concomitantly with CARDIZEM. (See WARNINGS.)

Controlled and uncontrolled domestic studies suggest that concomitant use of CARDIZEM and beta-blockers or digitalis is usually well tolerated. Available data are not sufficient, however, to predict the effects of concomitant treatment, particularly in patients with left ventricular dysfunction or cardiac conduction abnormalities. In healthy volunteers, diltiazem has been shown to increase serum digoxin levels up to 20%.

Carcinogenesis, Mutagenesis, Impairment of Fertility. A 24-month study in rats and a 21-month study in mice showed no evidence of carcinogenicity. There was also no mutagenic response in *in vitro* bacterial tests. No intrinsic effect on fertility was observed in rats.

Pregnancy. Category C. Reproduction studies have been conducted in mice, rats, and rabbits. Administration of doses ranging from five to ten times greater (on a mg/kg basis) than the daily recommended therapeutic dose has resulted in embryo and fetal lethality. These doses, in some studies, have been reported to cause skeletal abnormalities. In the perinatal/postnatal studies, there was some reduction in early individual pup weights and survival rates. There was an increased incidence of stillbirths at doses of 20 times the human dose or greater.

There are no well-controlled studies in pregnant women, therefore, use CARDIZEM in pregnant women only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers. Diltiazem is excreted in human milk. One report suggests that concentrations in breast milk may approximate serum levels. If use of CARDIZEM is deemed essential, an alternative method of infant feeding should be instituted.

Pediatric Use. Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

Serious adverse reactions have been rare in studies carried out to date, but it should be recognized that patients with impaired ventricular function and cardiac conduction abnormalities have usually been excluded.

In domestic placebo-controlled trials, the incidence of adverse reactions reported during CARDIZEM therapy was not greater than that reported during placebo therapy.

The following represent occurrences observed in clinical studies which can be at least reasonably asso-

ciated with the pharmacology of calcium influx inhibition. In many cases, the relationship to CARDIZEM has not been established. The most common occurrences as well as their frequency of presentation are: edema (2.4%), headache (2.1%), nausea (1.9%), dizziness (1.5%), rash (1.3%), asthenia (1.2%). In addition, the following events were reported infrequently (less than 1%):

Cardiovascular:	Angina, arrhythmia, AV block (first degree), AV block (second or third degree — see conduction warning), bradycardia, congestive heart failure, flushing, hypotension, palpitations, syncope
Nervous System:	Amnesia, gait abnormality, hallucinations, insomnia, nervousness, paresthesia, personality change, somnolence, tinnitus, tremor
Gastrointestinal:	Anorexia, constipation, diarrhea, dysgeusia, dyspepsia, mild elevations of alkaline phosphatase, SGOT, SGPT, and LDH (see hepatic warnings), vomiting, weight increase
Dermatologic:	Petechiae, pruritus, photosensitivity, urticaria
Other:	Amblyopia, dyspnea, epistaxis, eye irritation, hyperglycemia, nasal congestion, nocturia, osteoarthralgia, pain, polyuria, sexual difficulties

The following postmarketing events have been reported infrequently in patients receiving CARDIZEM: alopecia, gingival hyperplasia, erythema multiforme, and leukopenia. However, a definitive cause and effect between these events and CARDIZEM therapy is yet to be established. Issued 9/86

Another patient benefit product from

Conjoint Report To the North Carolina Medical Society and the North Carolina Commission for Health Services

Ronald H. Levine, M.D., M.P.H., State Health Director

I am providing a brief review of selected accomplishments and concerns of your state's public health system, and I will then dwell at some length on a topic very near to our hearts, i.e., cholesterol (sorry for the pun).

AIDS

During the past year, a comprehensive AIDS control program has been established in North Carolina focusing, in the absence of a vaccine or effective mode of treatment, on passive and active surveillance, education, counseling in risk reduction, and antibody testing where appropriate.

Approximately 200 cases of AIDS have been diagnosed in North Carolina, and 70% of those patients have already died. A more extensive report on AIDS is part of the scientific program of this meeting.

Immunization

Also during 1986, the landmark Childhood Vaccine-Related Injury Compensation Law was enacted by the General Assembly, the only statute of its kind in the U.S., and the new college immunization law was implemented. Yet, new problems have surfaced as regards universal immunization among our children.

During 1986, eighty-eight cases of whooping cough were reported; another 49 were reported in just the first quarter of 1987, suggesting that pertussis vaccination levels may be slipping. The price of vaccines remains unconscionably high, though we are hopeful that our new no-fault law will result in substantial lowering of DPT prices.

From North Carolina Department of Human Resources, P.O. Box 2091, Raleigh 27602-2091. Dr. Levine presented this report to the North Carolina Medical Society at its 133rd Annual Meeting, and to the North Carolina Commission for Health Services, April 1987.

Cervical Cancer

Initiatives have been undertaken to target cervical cancer among black women, because they suffer significantly greater cervical cancer mortality than do white women.

Phase One involves exploring the problem through working with 23 local health departments. Phase Two, to begin next fiscal year, involves the development and testing of intervention models and programs.

Dental Health

In dental health, we continue to improve our fluoridation coverage throughout the state, with 204 communities now participating. An additional 26 towns have naturally fluoridated water so that, altogether, the total population receiving fluoridated water is now 88% of those served by municipal water systems.

Maternal and Child Health

Maternal and child health concerns remain a major responsibility of North Carolina's public health community. In addition to newborn screening for PKU and hypothyroidism, we are now in the process of adding neonatal sickle cell and galactosemia screening.

Consideration is also being given to neonatal screening for biotinidase deficiency and, with the continued cooperation of the obstetric community, we hope to achieve in the very near future statewide accessibility of maternal serum screening for alpha-fetoprotein, elevation of which might herald a fetus with a significant neural tube defect.

Children's Special Health Services

With the support of your Medical Advisory Committee, we

have changed the name of the 51-year-old Crippled Children's Program to "Children's Special Health Services." The new name reflects the evolution of the program from purely neuromuscular-skeletal concerns to broad coverage of chronic pediatric disease.

Prenatal Care

You may be as shocked as we were to discover that, during 1985, more than 1,000 North Carolina births occurred to women who received no — I repeat, no — prenatal care. Compared to data from the previous year, this figure represents an alarming 21% increase. More regrettable yet, an additional increase is suggested by 1986 provisional data.

In an effort to gain more information about the crisis at hand, we have conducted patient and provider surveys to determine barriers to prenatal care in North Carolina. While data from the patient survey are still being analyzed, data from two provider surveys indicate that at least 49 obstetricians in 23 counties and 31 family physicians in 18 counties withdrew from prenatal care during the 12-month period prior to last March. Between March and November, an additional 36 physicians in 24 counties withdrew. These findings represent a serious threat to the health and well-being of our mothers and newborns, and are related in significant measure to the liability crisis.

Cancer Registry

During its 1986 session, the Legislature heeded Governor Martin's request, strongly supported by this Society, to fund a hospital-based statewide cancer registry. The Registry will be located in the State Center for Health Statistics. Several staff members are already on board, and the search for a registry director is under way.

The goal is for the Registry to become operational in January 1988 with gradual phasing in of North Carolina's hospitals. We will begin as an incidence registry with *passive* follow-up, whereby death certificates will be matched with Registry cases in order to determine survival rates. As the Registry continues to develop, we hope to conduct active follow-up whereby hospitals provide information on subsequent therapies, recurrences, last contact, and cause of death. This will make it possible to determine survival rates by site and stage of disease as well as treatment regimen. Finally, the Registry will ultimately give us invaluable information about possible environmental and occupational influences on cancer incidence.

Birth Defects Registry

A second initiative located in our State Center for Health Statistics is the North Carolina Birth Defects Registry. Initial development of this effort has been funded by the Kate B.

Reynolds Foundation. Data will be derived from birth and death certificates, fetal death reports, hospital discharge abstracts and Medicaid claims, among other sources.

In addition to providing for the analysis of trends and patterns in incidence and survival, data from the Birth Defects Registry may be useful in assessing the impact of prevention programs and environmental exposures, in predicting future costs of treatment and care, and in providing information for more informed genetic counseling and preventive medicine efforts.

We hope, ultimately, to collect hospital discharge information on all infants under one year, not just those with birth defects. This would allow for a clearer understanding of infant mortality in relation to birthweight and neonatal morbidity.

Beginning January 1988, as occurs each decade in the U.S., new birth, death, and fetal death certificates will be in place in North Carolina. Changes to the death certificate are minimal, but changes in the birth and fetal death certificates are extensive, including checklist formats for medical risk factors, behavioral risk factors, obstetric procedures, complications, method of delivery, and abnormal conditions and malformations of the newborn. The quality of this data depends upon the care and good judgment of our physicians and hospital personnel. Over the next few months, our Vital Records Branch will be conducting a series of workshops for hospital personnel involved in the completion of these very vital reports.

Cholesterol

Now on to the special topic. The plethora of food products being advertised as "Low in Cholesterol" or as having "No Cholesterol," and the attention focused by the mass media, demonstrate that the public is taking note of the problem of cholesterol and its impact on health. This attention is indeed warranted.

Elevated blood cholesterol has been established as a key risk factor for stroke and heart disease. Lack of exercise, obesity, hypertension, smoking and diabetes also contribute, of course. The recent Lipid Research Clinics Trial clearly demonstrates that efforts to reduce "definitely elevated blood cholesterol levels will reduce the risk of heart attacks due to coronary heart disease."

As I stated in my Conjoint Report to you last year in discussing hypertension, North Carolina is a "hot spot" for heart disease and cardiovascular disease. Our death rates from heart disease and stroke are well above the national average.

Each day in North Carolina, 45 adults die prematurely. Fifteen of these deaths are attributable to cardiovascular disease. These deaths rob North Carolina of valuable human and financial resources. They occur during the most productive years of life and cause hardship on families, friends, and communities.

In December 1984, the National Institutes of Health convened a Consensus Development Conference on Lowering Blood Cholesterol to Prevent Heart Disease. The Conference examined the relationship between blood cholesterol and heart attacks and the steps that should be taken to diagnose and treat elevated blood cholesterol levels. The Conference concluded that "blood cholesterol levels above 200 mg/dl are associated with an increased risk of developing premature coronary heart disease." They put forth the goal of reducing blood cholesterol levels of the entire adult population of the United States. The Consensus Conference further concluded that each 1% reduction in blood cholesterol level yields approximately a 2% reduction in coronary heart disease rates. A very modest decrease in population blood cholesterol levels of less than 7% should reduce coronary heart disease by 13%. The result would be the prevention of two premature deaths each day in North Carolina.

Before significant progress can be made in saving lives and dollars by lowering the elevated blood cholesterol levels found among North Carolinians, the medical community and public health system need to work together to stimulate an awareness among health professionals and the public of the relationship between elevated blood cholesterol levels and cardiovascular disease.

The National Cholesterol Awareness Survey was conducted in the Spring of 1986. The results indicated that half of all physicians do not initiate diet therapy unless blood cholesterol values reach 240 mg/dl. One in four physicians reserves diet therapy for patients with levels above 260 mg/dl. Thus, many patients at moderate risk, those between 200 and 240 mg/dl, are not receiving dietary advice and counseling.

Awareness needs to increase among the public as well, although nearly three-quarters of the public now recognize the relation of elevated blood cholesterol to coronary heart disease, and almost half state that they have had their blood cholesterol measured.

It is clear that the NIH Consensus Conference recommendations need to be put fully into practice, especially the recommendation that blood cholesterol levels be reduced to less than 200 mg/dl. How?

The first step in the treatment of high-risk and moderate-risk blood cholesterol levels is diet therapy to reduce fat intake, and caloric restriction for the overweight. The use of diet as a primary mode of therapy requires a major effort on the part of physicians, nutritionists, dietitians, and other health professionals. Lifestyle changes are difficult without adequate instructions, motivation, and encouragement. Every opportunity to teach needs to be used to advantage.

Only after a careful trial of diet modification, using the most rigorous diet appropriate for the particular individual, should drug therapy be used. Even when drugs seem appropriate, it is important to stress that maximal diet therapy should be continued. We still do not have adequate evidence of the safety of any cholesterol-lowering drugs when given over decades; therefore, drug treatment should be under-

taken cautiously, and its desirability should be periodically reevaluated, particularly in children.

Poor patient compliance is sometimes cited as a reason not to prescribe diet therapy and/or bile acid sequestrants at the blood cholesterol levels recommended by the Consensus Conference. Improving patient compliance requires thorough patient education and the provision of opportunities for patients to participate in tailoring the treatment plan to their own needs and abilities. This is an area in which the public health system and the physician community can cooperate to great advantage. Some health departments offer nutrition counseling to help patients achieve the treatment goals set by their physicians. Check with your local health department to find out if this service is available for your patients.

Given that the effects of dietary lipids and cholesterol on blood cholesterol and LDL levels are now sufficiently known, and that so many North Carolinians are at risk, population-wide strategies are both indicated and appropriate. In this regard, the National Heart, Lung and Blood Institute is mounting a major campaign, the National Cholesterol Education Program, to alert both the medical profession and the public to these issues.

Our agency is currently engaged in disseminating the Program's materials in North Carolina. One such project is a series of public service announcements which are presently being aired on television stations across the state encouraging viewers to "Know your number," i.e., their blood cholesterol values. The North Carolina Medical Society and local societies are cooperating by serving as a source to which the Department of Human Resources' toll-free Careline can refer persons who do not have a personal physician. On May 21, 1987, the Division of Health Services, the University of North Carolina - Chapel Hill School of Medicine and School of Public Health, and the North Carolina Heart Association . . . co-sponsored a training conference on Nutrition and Cardiovascular Health. The conference was for physicians, nutritionists, and other health professionals.

Local health departments are also confronting the cholesterol issue. Their screening activities will result in referrals to you for diagnosis and treatment. As mentioned earlier, you may wish to refer your patients to the health department for follow-up services such as nutrition counseling and education. One example of the services which may be available is the Craven County Health Department, where the nutritionists have adapted to North Carolina food practices the Culinary Hearts Kitchen Course developed by the New York Heart Association. They have taught this North Carolina version of the course which explains how to eat in a "heart healthy" way, North Carolina style, to many community groups in their county.

There are many other strategies for lowering blood cholesterol levels among groups of individuals at risk and the community as a whole. These include food labeling to convey more accurate information and the availability of "heart

healthy" foods in worksite cafeterias, fast food restaurants, and vending machines.

I believe strongly that, just as with hypertension control, the medical community and the public health system can and must collaborate in order to decrease the prevailing blood cholesterol levels of North Carolinians, thereby improving the quality of life as well as its length.

Fifty years ago your President, Dr. Strosnider of Goldsboro, recognized his physician colleagues in the specialty of Public Health and Preventive Medicine thusly, and I quote: "You contact the individual, you contact the remote

communities, you many times bring the people to realize what scientific medicine has to offer. . . . You point out the rule and direct the individual's footsteps to those of our profession who are able to alleviate suffering, to care and to prolong life. You should feel very proud."

I speak not only for myself and for Dr. Meredith and the entire Health Commission, but for the entire public health family in North Carolina in saying that we are most proud of the collaborative relationship that we enjoy with North Carolina's practicing physicians, a relationship that surely no other state can match. ■

THE FUTURE IS NOW WITH THE ELIMINATOR

"Eliminator" is a fairly harsh word to describe an x-ray generator. However, the Compu-mAs system from Bennett X-Ray Corp. and B & B X-Ray does so many things for you, there's no other word to explain it. The generator automatically calculates the next available mAs from the 34 time stations and the 7 mA stations, therefore eliminating many of the steps that were once necessary in taking x-rays.

The Compu-mAs:

- Eliminates setting major and minor kVp tap switches
- Eliminates setting high and low range for kV selectors
- Eliminates calculating mA \times time to find mAs
- Eliminates checking and adjusting line compensation
- Eliminates the need to set both mA and time

By eliminating all of these steps, the Eliminator moves into the future without sacrificing dependability and accuracy. Dependability has been a benefit of owning a Bennett Radiographic System for over 30 years. And now, by automatically selecting the next available mAs combination of mA and time, Compu-mAs provides accuracy to almost infinite resolution. The Compu-mAs Eliminator—just another way B & B X-Ray is working for your end result, optimum quality radiographs.

B & B X R A Y

working for the end result—optimum quality radiographs

AIDS

Report of the Board of Trustees of the American Medical Association

Alan R. Nelson, M.D., Chairman

Excerpted from the AMA Interim Report (YY, A-87) on
prevention and control of AIDS

Responding sensitively, intelligently, and effectively to the growing AIDS crisis is one of the crucial public health problems facing the nation. Prevention and control of the disease must be an essential part of that response because there is, at present, no known cure for AIDS patients.

Recommendations in this report have as their foundation an overriding concern for a judicious balance between the well-being of HIV positive patients and the protection of the public health.

Education continues to be the major weapon against spread of HIV infection. Physicians should assume the leadership role in educating themselves, their patients and the public. Individuals in society also must assume responsibility for being well-informed and for actions that affect their own health and the health of others.

Background

The Current Climate

It is estimated that five to ten million people are infected with HIV virus worldwide. AIDS has been reported in more than 100 countries. In the United States HIV-infected individuals may number 1.5 million, approximately 35,000 of whom have been reported to suffer from AIDS and more than 20,000 of whom are dead.

The U.S. Public Health Service has projected that by 1991 there may be 323,000 reported patients with AIDS and as many as 200,000 of them may be dead by that time. In addition, conversion rates of seropositive people to AIDS status now appear to be higher than early preliminary estimates. Originally under 20% were thought to convert. It now appears that, without treatment advances, a much higher percentage will develop the disease.

The Challenge of AIDS Control

Since there is no cure for AIDS and no protection beyond

avoiding or making safer intimate contact with infected individuals, those infected with the virus must be sexually isolated from uninfected persons. A condom barrier offers some but not complete protection. Avoidance of sexual contact and of the use of shared needles are the only sure protections.

Further, the stigma that accompanies a diagnosis of AIDS, based on fear and society's attitude toward IV drug abusers and homosexuals, presents a factor beyond the control of the infected individual or medicine. An HIV-seropositive individual who might live five years or much longer with no overt health problems, once identified in a community, may be subject to many and varied discriminations — by family and loved ones, by neighbors and friends, by employers and fellow employees, and by other providers of services.

As with prevention and control of all contagious diseases, prevention and control of AIDS involves two, sometimes competing, concerns. First, the person who is afflicted with the disease needs compassionate treatment, and both those who have the disease and those who have been infected with the virus should not be subjected to irrational discrimination based on fear, prejudice or stereotype. Second, and of critical importance, the uninfected must be protected; those individuals who are not infected with the AIDS virus must have every opportunity to avoid transmission of the disease to them.

The Need for a National Policy on AIDS

Given the growing dimensions of the crisis and given limited national resources, it is imperative that a national policy be developed jointly by the public and private sectors. Such a policy must seek, in a cost-effective way, to achieve fundamental national goals: prevention, treatment, and cure —

and adequate research in all three areas. A coherent national approach to this modern killer is needed: a comprehensive blueprint for a national response, not piecemeal solutions. Knowledge of the disease is now more than six years old and the growing magnitude of the problem has been apparent for nearly that long.

Recommendation 1

A commission should be constituted with representatives from the Executive branch of the federal government, the Congress, state and local government, and the private sector and directed to develop a consensus position for consideration by the Congress, the Executive, state and local governments and private associations and institutions. The presidential commission announced . . . by the Administration could be broadened to implement this recommendation. A high-level body with representatives from the different branches and levels of government, but operating to the side of the more formal political processes, may have the best chance of forging the necessary national consensus which can then become the basis for concerted and coordinated action by both the public and private sectors.

The Special Role of Physicians and Other Health Care Counselors

Because there is no cure for AIDS, effective preventive techniques are vital. This involves both those who are infected and those who are not. Those who are infected must be identified so that they will not unknowingly transmit the disease to others. Many who are not infected will need to change their behavior substantially to minimize their risk of infection by the AIDS virus. The key to changed behavior is public education coupled with counseling which must be given by physicians and other health care counselors.

Public Awareness

The public is well aware of AIDS in a general sense. The attention of the media has been intensively focused on the disease. Translating general awareness into modifications of behavior is the challenge.

The groups that are most at risk for AIDS, e.g., IV drug abusers, homosexuals, bisexuals, and prostitutes, have reason to know they are at risk. Their contacts, however, may not know they are at risk and hence spouses, unborn babies, and premarital and extramarital sexual partners may become infected. Education and counseling aimed at the high-risk groups must be the first priority. The education should urge immediate counseling with a physician or other health care counselor about the risk of AIDS, the uses of antibody testing and preventive measures.

Also, it must be recognized that persons in these groups may not respond to education and counseling and, when

they do not, more aggressive programs — such as expanded methadone maintenance programs or penalties for knowingly exposing others — must be considered.

Education aimed at the more general population is difficult for at least two reasons. First, reaching all Americans with an effective message can be expensive and not all people respond in the same way or to the same method of learning. Messages must therefore be tailored to the target audience in question. Second, preventive messages must necessarily deal with controversial subject matter. Widespread use of the electronic media — especially television — appears to be the most effective way to reach the general public. Accordingly, public service advertising on the electronic media must be greatly increased and these announcements must be shown at times and in places where they will be viewed by those who need the message most.

The AMA will continue its efforts to place its own public service ads on national television. AMA's Tony Danza public service advertisement (PSA) directed at teenagers about abstinence and condoms, and other PSAs which the networks have agreed to use, are significant first steps. But, more must be done and it must be nationally coordinated.

Recommendation 2

The communications industry must develop voluntary guidelines for public service advertising regarding AIDS in consultation with the health care community and government officials. The AMA intends to be a catalyst in this effort to immediately bring the communications and health care communities together.

Counseling — and Educating Counselors

Perhaps the greatest need at the present time is effective counseling of both low-risk and high-risk populations by physicians or other health care counselors. A massive education effort for physicians and other counselors is necessary as a first step. Complete and accurate information on the disease, the modes of transmission, the appropriate application of antibody testing, and effective ways to change behavior must be understood by counselors if it is to be properly communicated to patients. In conjunction with face-to-face counseling, printed materials — like the Surgeon General's recent 36-page report on AIDS — should be widely disseminated.

Even more challenging than preparing physicians and others for generic counseling on AIDS is preparing these counselors to assist those who test positive and are infected with the virus. It is at that time that a change of behavior on the part of the person infected is most critical, and it is then that the most sophisticated counseling is required due to the emotional impact of the test results. There is no higher prevention priority than ensuring that the community of individuals who provide health care counseling be given

adequate tools to be effective. And the AMA, as the largest organization of physicians in the world, must take a leading role in this undertaking.

Recommendation 3

A conference should be immediately held between the AMA, other physician organizations and public health officials at all levels of government to determine:

- 1 The types of education and training that are necessary for effective counseling.
- 2 The people in the health care community who should receive this education and training.
- 3 The current resources available for such education and training.
- 4 Recommendations for providing additional resources, including consideration of the respective roles of medical associations and government at all levels.
- 5 Recommendations on how to update information continually as new scientific data are developed.
- 6 Recommendations as to alternative measures to prevent the spread of AIDS where education and counseling are not likely to be effective, particularly among IV drug users, through such programs as expanded methadone maintenance.

The AMA will promptly and widely report on the conference findings and assist in the implementation of the conference recommendations.

Voluntary and Mandatory Testing

Knowledge that a person is infected with the AIDS virus can be the crucial predicate to changing behavior. Thus, testing for an antibody to the AIDS virus, when used in conjunction with appropriate counseling (and when offered in the context of appropriate anti-discrimination and confidentiality protections discussed below), serves the important public health purpose of providing impetus for behavior changes that minimize the risk of transmitting the AIDS virus.

Clearly, the need for HIV-antibody testing has expanded beyond the original purpose, the screening of blood donors. Guidelines for the appropriate use of HIV-antibody testing must center on the following justifications:

- 1 To identify infected persons and to offer treatment where possible and to protect uninfected third parties.
- 2 To offer education and counseling that would modify high-risk behavior.
- 3 To solicit patient cooperation for locating and referring sex partners.
- 4 To obtain broadened epidemiological statistics on the prevalence of HIV infection in the population.

Except for individuals in the limited categories listed in Recommendation 5 below (blood, organ and semen donors,

immigrants, military personnel, prison inmates), with regard to whom testing serves well-established and well-accepted protection goals, mandatory national testing should not, at present, be broadly extended.

Military personnel have traditionally been subject to mandatory immunizations and our defense forces, of course, must be as strong as possible. Prison inmates, because they are confined and have a higher incidence of high-risk individuals than the general population, require special protection. Immigrants should be tested so that we can focus on the AIDS problem already here, and the nation certainly has the right to bar entrants with communicable diseases. The need to test donors of blood, organs and semen has never been questioned.

Public health authorities have advanced a plausible premise for their opposition to mandatory testing of homosexuals and drug abusers: such testing will only drive people underground and away from the health care system. Public health authorities also have advanced a premise for not requiring mandatory testing of large segments of the general population, such as all those seeking marriage licenses or all those admitted to hospitals: such testing in low prevalence populations would result in a high proportion of false positives, and would not be cost-effective, given the demand for voluntary testing and the shortage of testing and counseling resources for those who want them voluntarily or who will want them following effective public awareness campaigns.

Until those premises are shown by superior studies to be incorrect, a policy regarding mandatory testing which has been rejected by the vast majority of public health officials, including the Centers of Disease Control and the Surgeon General, cannot be recommended.

But certain high-risk groups should be regularly tested, with a right to informed consent and to refuse the test. Those groups are defined in Recommendation 6.

In addition, physicians and other hospital personnel involved in invasive surgical procedures who necessarily and unavoidably come in contact with the blood of patients, need to be aware of their risks. Limited regular testing of patients will assure that the CDC guidelines for the protection of hospital personnel are followed rigorously and will further assure that all patients receive prompt and full treatment. The Board emphasizes here that physicians have a long and honored tradition of tending to patients afflicted with infectious diseases with compassion and courage. That tradition must and will be continued throughout the AIDS epidemic.

Because the risk to health care personnel will be slight in most areas, any effort at mandatory testing of certain kinds of patients should be instituted after voluntary testing has failed and where a variety of factors, e.g., the costs and availability of proper testing and counseling as measured against the risk presented by the relative presence of a high-risk patient population, weigh in favor of mandatory testing.

The AMA does not believe it appropriate at this time to

extend regularly offered testing to persons other than those listed, e.g., recommended testing should not be extended to all individuals anywhere who are considering marriage or to all persons in hospitals. Decisions about whether there should be generally recommended testing to other types of individuals should, at this time, be left to the decision of the local community depending on its own circumstances and the judgments of its own public health officials.

At present, each case of AIDS must be reported by the individual physician to state public health authorities either by name or identifier. Anonymous, or if carefully implemented, confidential reporting should also be extended to all confirmed instances of persons infected with AIDS virus but not afflicted with ARC or AIDS. Individuals who are seropositive for the HIV antibody are infected with the virus and can spread the disease as certainly as those with symptoms of AIDS. A sound epidemiologic understanding of the potential impact of AIDS on society requires the reporting of those who are confirmed as testing positive for the antibody to the AIDS virus.

Recommendation 4

Tests for the AIDS virus should be readily available to all who wish to be tested. The tests should be routinely subsidized for individuals who cannot afford to pay the cost of their test.

Recommendation 5

Testing for the AIDS virus should be mandatory for donors of blood and blood fractions, organs and other tissues intended for transplantation in the United States or abroad, for donors of semen or ova collected for artificial insemination or invitro fertilization, for immigrants to the United States, for inmates in federal and state prisons and for military personnel.

Recommendation 6

Voluntary testing should be regularly provided for the following types of individuals who give an informed consent:

- 1 Patients at sexually transmitted disease clinics.
- 2 Patients at drug abuse clinics.
- 3 Pregnant women in high-risk areas in the first trimester of pregnancy.
- 4 Individuals who are from areas with a high incidence of AIDS or who engage in high-risk behavior and who are seeking family planning services.
- 5 Patients who are from areas with a high incidence of AIDS or who engage in high-risk behavior and who require surgical or other invasive procedures. If the voluntary policy is not sufficiently accepted, the hospital and medical staff should consider a mandatory program for the institution.

Recommendation 7

As a matter of medical judgment, physicians should en-

courage voluntary HIV testing for individuals whose history or clinical status warrant this measure.

Recommendation 8

Individuals who are found to be seropositive for the AIDS virus should be reported to appropriate public health officials on an anonymous or confidential basis with enough information to be epidemiologically significant.

Recommendation 9

Physicians should counsel patients before tests for AIDS to educate them about effective behaviors to avoid the risk of AIDS for themselves and others. In public screening programs, counseling may be done in whatever form is appropriate given the resources and personnel available as long as effective counseling is provided.

Recommendation 10

Physicians should counsel their patients who are found to be seropositive regarding (a) responsible behavior to prevent the spread of the disease, (b) strategies for health protection with a compromised immune system, and (c) the necessity of alerting sexual contacts, past (5-10 years) and present, regarding their possible infection by the AIDS virus. Long-term emotional support should be provided or arranged for seropositive individuals.

Recommendation 11

Patients should knowingly and willingly give consent before a voluntary test is conducted.

Resources

Only recently have Congress and the Administration begun to seriously consider the vast resources needed to deal effectively with AIDS. Federal funding for 1988 is expected to reach \$1 billion. But that amount will not be enough. The AMA endorses the bill introduced by Congressman Waxman to increase resources for testing and counseling.

Testing for the HIV virus in America will require substantially more resources than are currently being made available. Trained counselors, materials for counseling, and research on effective counseling approaches, for the variety of population groups that need these services, are urgently required. Also, dependable testing facilities with sufficient capacity to respond to the epidemic are needed now. In addition, funds for research and care must be increased to fully exploit the nation's capacity to respond effectively to this crisis.

The key premise of a prevention strategy, when there is no vaccine, is behavioral change on the part of those infected and those at risk of infection by AIDS virus. It is therefore crucial that there be immediate and systematic studies conducted of how behavior of affected groups may have changed in recent years, and if possible, what factors caused the

changes. Most particularly, it is necessary to study and evaluate the types of counseling that have been effective so that the techniques may be replicated widely. There can be little question that in a free society suasion and voluntary change, if effective, are far preferable to compulsion.

Recommendation 12

Public funding must be provided in an amount sufficient (1) to promptly and efficiently counsel and test for AIDS, (2) to conduct the research necessary to find a cure and develop an effective vaccine, (3) to perform studies to evaluate the efficiency of counseling and education programs on changing behavior and (4) to assist in the care of AIDS patients who cannot afford proper care or who cannot find appropriate facilities for treatment and care.

Protection Against Discrimination

The AMA believes strongly that AIDS victims and those who test positively for the antibody to the AIDS virus should not be treated unfairly or suffer from arbitrary or irrational discrimination in their daily lives. Last year, the AMA filed a friend of the court brief in *School Board of Nassau County v. Arline*, a case before the Supreme Court which addressed the question of how the federal handicapped anti-discrimination laws should apply to persons afflicted with contagious diseases. The AMA set forth a framework for the application of the law which the Supreme Court adopted, quoting verbatim from the AMA brief in its key holding.

A sound anti-discrimination approach does not allow reflexive discrimination against AIDS victims based on fear or stereotype or prejudice. Nor does it require that all employers or other federal fund recipients automatically accommodate a person afflicted with a communicable disease. Instead, based on an individualized analysis of the nature and duration of the handicap and the nature and duration of the communicability, a federal fund recipient must make a reasonable accommodation based on reasonable medical judgments, given the state of medical knowledge at the time. This sound framework for carefully balancing the two competing concerns — the right of the victim to be free from irrational acts of prejudice and the right of others to be protected against an unreasonable risk from disease — should also guide state anti-discrimination efforts.

A key question left open by the Supreme Court is whether a person who is not afflicted with AIDS or AIDS Related Complex, but who nonetheless tests positive for the antibody, is protected by the federal anti-discrimination law.

In order to encourage people to seek counseling, and testing if necessary, the AMA strongly urges that anti-discrimination laws at both the federal and state levels be clarified either by regulatory interpretation or statutory amendment to cover those who test HIV antibody positive. Allowing irrational discrimination against those who test positive serves no useful purpose: it only has the destructive

effect of removing those who are otherwise productive members of society from the work force or otherwise denying them access to an important aspect of normal life. While the federal law should continue to apply only to federal fund recipients, state laws should be sought to prevent irrational discrimination by entities or individuals within those jurisdictions.

Recommendation 13

Anti-discrimination laws must be clarified or amended to cover those who test positive for antibodies to the AIDS virus.

Confidentiality

The ability of the health care community to maintain the confidentiality of patient information and restrict its use to only those purposes essential for maintenance of health is, like clarification of anti-discrimination laws, vital to an effective program of preventing and controlling AIDS. The basic principle should be that access to patient information should be limited only to health care personnel who have a legitimate need to have access to the information in order to assist the patient or to protect the health of others closely associated with the patient.

As with anti-discrimination laws, laws protecting the confidentiality of patient information should be on both federal and state agendas.

Recommendation 14

Model confidentiality laws must be drafted which can be adopted at all levels of government to encourage as much uniformity as possible in protecting the identity of AIDS patients and carriers, except where the public health requires otherwise.

Questions for the Future

As the national debate on prevention and control of AIDS continues, other important issues will need to be addressed.

Research and Data

There is an urgent and critical need for more scientifically sound data on the prevalence and spread of virus in the general population. At the present time only those cases that meet the current CDC surveillance definition of AIDS are reported to that institution. Since AIDS is the terminal and fatal stage of HIV-infection, it represents only the tip of the huge HIV-infection iceberg. How large the base of the iceberg really is — that is, how many people are actually infected — can only be estimated from the number of reported AIDS cases. That has been done by using a multiple

(50 to 100 times the number of AIDS cases) that has been extracted largely from surveys done in high-prevalence areas. Yet this same multiple has been used to estimate the number of current and potential HIV-infected persons in low-prevalence areas and for that matter the entire country and even the world. The CDC itself is unsure about the accuracy of its estimates. Yet if economic and medical plans are to be made for the future, reliable projections must be available. How sufficient or exaggerated these plans may be depends upon the accuracy of current and future estimates of HIV-infected persons, particularly as to the extent of its spread into the low-risk heterosexual population.

Not only are accurate estimates of HIV-infected persons needed, but so too are reliable data on the rate of conversion of asymptomatic seropositive persons to clinical illness, including AIDS, that requires increased medical care. This information is important for the formulation of plans for the future cases of potentially hospitalizable patients and the economic consideration thereof. HIV-infection has protean manifestations and death can result not only from AIDS itself, but from severe ARC or progressive CNS disease as well. In order to obtain accurate information in HIV infected persons on the rate of conversion from asymptomatic to clinically severe illness, baseline data on their serologic status must be obtained as early as possible — not after clinically manifest disease is present. The presence of HIV antibodies indicates not only current infection with the virus, but also that the patient is potentially capable of transmitting the disease. This follows from the fact that HIV integrates its genome into the host cell genome with the result that once infected, the patient remains infected for life and is, therefore, capable of life-long transmission of the agent. The earlier the infected person is detected, the earlier he or she may be advised of this contagious state and counseled on how to avoid further transmission of this lethal virus.

Recommendation 15

Consistent with the proposal by the Secretary of Health and Human Services, a national study in various areas of the country must be immediately undertaken to determine the prevalence and conversion rate of the virus in the United States population, and the study must be repeated at appropriate intervals to gauge the spread of the disease.

Warning to Third Parties

One of the more difficult issues for society is how to warn unsuspecting spouses or sexual partners of persons who test HIV positive. Such a warning would allow the third party to practice "safer" sex or to abstain from sexual relations with the infected person altogether. Given the life-or-death

consequences, the unsuspecting third party should, as a general matter, be warned because there is no cure and because it may not be responsible to rely solely on the infected person to provide a suitable warning.

Physicians who have reason to believe that there is an unsuspecting sexual partner of an infected individual should be encouraged to inform public health authorities. The duty to warn the unsuspecting sexual partner should then reside in the public health authorities as well as the infected person and not in the physician to the infected person.

The AMA believes that mechanisms, analogous to those used by public health authorities to warn sexual partners about other sexually transmitted diseases, should be put in place to warn unsuspecting third parties about an infected sexual partner. Such warning may be appropriate whether the infected person is bisexual, heterosexual or homosexual.

This problem raises the general question of whether anonymous reporting should continue to be the standard for persons who test seropositive. Our recommendation at this time is limited to situations where physicians or health officials already know the identity of the AIDS carrier and have reason to believe a risk to third parties exists.

Recommendation 16

Specific statutes must be drafted which, while protecting to the greatest extent possible the confidentiality of patient information, (a) provide a method for warning unsuspecting sexual partners, (b) protect physicians from liability for failure to warn the unsuspecting third party but (c) establish clear standards for when a physician should inform the public health authorities, and (d) provide clear guidelines for public health authorities who need to trace the unsuspecting sexual partners of the infected person.

Sanctions for Reckless Disregard for the Safety of Others

A related question which must be explored is whether an infected person, who knows he or she is infected and who knowingly fails to warn a sexual partner of the infection, should be subject not just to tort suits, but to a proceeding brought by state authorities to sanction the individual.

Recommendation 17

Given the risk of infection being transmitted sexually, and given the dire potential consequences of transmission, serious consideration should be given to sanctions, at least in circumstances where an unsuspecting sexual partner subsequently finds out about a partner's infection and brings a complaint to the attention of authorities. Pre-emptive sanctions are not being endorsed by this recommendation. ■

Once-a-day

Rocephin[®]

IV·IM

ceftriaxone sodium/Roche

* ROCEPHIN is indicated in the following infections: bacterial septicemia, bone and joint, intra-abdominal, lower respiratory tract, skin and skin structure, urinary tract, bacterial meningitis and gonorrhea. Please see summary of product information on adjacent page for indicated susceptible organisms.

Rocephin® IV·IM

ceftriaxone sodium/Roche

Before prescribing, please consult complete product information, a summary of which follows:

MICROBIOLOGY The bactericidal activity of ceftriaxone results from inhibition of cell wall synthesis. Ceftriaxone has a high degree of stability in the presence of beta-lactamases, both penicillinases and cephalosporinases, of gram-negative and gram-positive bacteria. Ceftriaxone is usually active against the following microorganisms *in vitro* and in clinical infections (see Indications and Usage):

GRAM-NEGATIVE AEROBES: *Enterobacter aerogenes*, *Enterobacter cloacae*, *Escherichia coli*, *Haemophilus influenzae* (including ampicillin-resistant strains), *H. parainfluenzae*, *Klebsiella* species (including *K. pneumoniae*), *Neisseria gonorrhoeae* (including penicillinase and nonpenicillinase producing strains), *Neisseria meningitidis*, *Proteus mirabilis*, *Proteus vulgaris*, *Morganella morganii* and *Serratia marcescens*.

Note: Many strains of the above organisms that are multiply resistant to other antibiotics, e.g., penicillins, cephalosporins and aminoglycosides, are susceptible to ceftriaxone sodium. Ceftriaxone is also active against many strains of *Pseudomonas aeruginosa*.

GRAM-POSITIVE AEROBES: *Staphylococcus aureus* (including penicillinase-producing strains) and *Staphylococcus epidermidis* (Note: methicillin-resistant *Staphylococcus* are resistant to cephalosporins, including ceftriaxone), *Streptococcus pyogenes* (Group A beta-hemolytic streptococcus), *Streptococcus agalactiae* (Group B streptococcus) and *Streptococcus pneumoniae* (Note: Most strains of enterococci, *Streptococcus faecalis* and Group D streptococci are resistant).

Ceftriaxone also demonstrates *in vitro* activity against the following microorganisms, although the clinical significance is unknown:

GRAM-NEGATIVE AEROBES: *Citrobacter freundii*, *Citrobacter diversus*, *Providencia* species (including *Providencia rettgeri*), *Salmonella* species (including *S. typhi*), *Shigella* species and *Acinetobacter calcoaceticus*.

ANAEROBES: *Bacteroides* species, *Clostridium* species (Note: most strains of *C. difficile* are resistant).

SUSCEPTIBILITY TESTING Standard susceptibility disk method: Quantitative methods that require measurement of zone diameters give the most precise estimate of antibiotic susceptibility. One such procedure (Bauer AW, Kirby WM, Sherris JC, Turck M: Antibiotic Susceptibility Testing by a Standardized Single Disk Method. *Am J Clin Pathol* 45:493-496, 1966; Standardized Disk Susceptibility Test, Federal Register 39 19182 19184, 1974; National Committee for Clinical Laboratory Standards, Approved Standard, ASM 2, Performance Standards for Antimicrobial Disk Susceptibility Tests, July 1975) has been recommended for use with disks to test susceptibility to ceftriaxone.

Laboratory results of the standardized single-disk susceptibility test using a 30-mcg ceftriaxone disk should be interpreted according to the following three criteria:

1. Susceptible organisms produce zones of 18 mm or greater, indicating that the tested organism is likely to respond to therapy.

2. Organisms that produce zones of 14 to 17 mm are expected to be susceptible if a high dosage (not to exceed 4 gm per day) is used or if the infection is confined to tissues and fluids (e.g., urine), in which high antibiotic levels are attained.

3. Resistant organisms produce zones of 13 mm or less, indicating that other therapy should be selected. Organisms should be tested with the ceftriaxone disk, since ceftriaxone has been shown by *in vitro* tests to be active against certain strains found resistant to cephalosporin class disks.

Organisms having zones of less than 18 mm around the cephalothin disk are not necessarily of intermediate susceptibility or resistant to ceftriaxone.

Standardized procedures require use of control organisms. The 30-mcg ceftriaxone disk should give zone diameters between 29 and 33 mm, 22 and 28 mm and 17 and 23 mm for the reference strains *E. coli* ATCC 25922, *S. aureus* ATCC 25923 and *P. aeruginosa* ATCC 27853, respectively.

DILUTION TECHNIQUES: Based on the pharmacokinetic profile of ceftriaxone, a bacterial isolate may be considered susceptible if the MIC value for ceftriaxone is not more than 16 mcg/ml. Organisms are considered resistant to ceftriaxone if the MIC is equal to or greater than 64 mcg/ml. Organisms having an MIC value of less than 64 mcg/ml but greater than 16 mcg/ml are expected to be susceptible if a high dosage (not to exceed 4 gm per day) is used or if the infection is confined to tissues and fluids (e.g., urine), in which high antibiotic levels are attained.

E. coli ATCC 25922, *S. aureus* ATCC 25923 and *P. aeruginosa* ATCC 27853 are also the recommended reference strains for controlling ceftriaxone dilution tests. Greater than 95% of MICs for the *E. coli* strain should fall within the range of 0.016 to 0.5 mcg/ml. The range for the *S. aureus* strain should be 1 to 2 mcg/ml, while for the *P. aeruginosa* strain the range should be 8 to 64 mcg/ml.

INDICATIONS AND USAGE: Rocephin is indicated for the treatment of the following infections when caused by susceptible organisms:

LOWER RESPIRATORY TRACT INFECTIONS caused by *Strep. pneumoniae*, *Streptococcus* species (excluding enterococci), *Staph. aureus*, *H. influenzae*, *H. parainfluenzae*, *Klebsiella* species (including *K. pneumoniae*), *E. coli*, *E. aerogenes*, *Proteus mirabilis* and *Serratia marcescens*.

SKIN AND SKIN STRUCTURE INFECTIONS caused by *Staph. aureus*, *Staph. epidermidis*, *Streptococcus* species (excluding enterococci), *E. cloacae*, *Klebsiella* species (including *K. pneumoniae*), *Proteus mirabilis* and *Pseudomonas aeruginosa*.

URINARY TRACT INFECTIONS (complicated and uncomplicated) caused by *E. coli*, *Proteus mirabilis*, *Proteus vulgaris*, *M. morganii* and *Klebsiella* species (including *K. pneumoniae*).

UNCOMPLICATED GONORRHEA (cervical/urethral and rectal) caused by *Neisseria gonorrhoeae*, including both penicillinase and nonpenicillinase producing strains.

PELVIC INFLAMMATORY DISEASE caused by *N. gonorrhoeae*.

BACTERIAL SEPTICEMIA caused by *Staph. aureus*, *Strep. pneumoniae*, *E. coli*, *H. influenzae* and *K. pneumoniae*.

BONE AND JOINT INFECTIONS caused by *Staph. aureus*, *Strep. pneumoniae*, *Streptococcus* species (excluding enterococci), *E. coli*, *P. mirabilis*, *K. pneumoniae* and *Enterobacter* species.

INTRA-ABDOMINAL INFECTIONS caused by *E. coli* and *K. pneumoniae*.

MENINGITIS caused by *H. influenzae*, *N. meningitidis* and *Strep. pneumoniae*. Ceftriaxone has also been used successfully in a limited number of cases of meningitis and shunt infections caused by *Staph. epidermidis* and *E. coli*.

PROPHYLAXIS: The administration of a single dose of ceftriaxone preoperatively may reduce the incidence of postoperative infections in patients undergoing coronary artery bypass surgery.

Although ceftriaxone has been shown to have been as effective as cefazolin in the prevention of infection following coronary artery bypass surgery, no placebo-controlled trials have been conducted to evaluate any cephalosporin antibiotic in the prevention of infection following coronary artery bypass surgery.

SUSCEPTIBILITY TESTING: Before instituting treatment with Rocephin, appropriate specimens should be obtained for isolation of the causative organism and for determination of its susceptibility to the drug. Therapy may be instituted prior to obtaining results of susceptibility testing.

CONTRAINDICATIONS: Rocephin is contraindicated in patients with known allergy to the cephalosporin class of antibiotics.

WARNINGS: BEFORE THERAPY WITH ROCEPHIN IS INSTITUTED, CAREFUL INQUIRY SHOULD BE MADE TO DETERMINE WHETHER THE PATIENT HAS HAD PREVIOUS HYPERSENSITIVITY REACTIONS TO CEPHALOSPORINS, PENICILLINS OR OTHER DRUGS. THIS PRODUCT SHOULD BE GIVEN CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. ANTIBIOTICS SHOULD BE ADMINISTERED WITH CAUTION TO ANY PATIENT WHO HAS DEMONSTRATED SOME FORM OF ALLERGY, PARTICULARLY TO DRUGS. SERIOUS ACUTE HYPERSENSITIVITY REACTIONS MAY REQUIRE THE USE OF SUBCUTANEOUS EPINEPHRINE AND OTHER EMERGENCY MEASURES.

Pseudomembranous colitis has been reported with the use of cephalosporins (and other broad spectrum antibiotics), therefore, it is important to consider its diagnosis in patients who develop diarrhea in association with antibiotic use.

ROCEPHIN® (ceftriaxone sodium/Roche)

Treatment with broad spectrum antibiotics alters the normal flora of the colon and may permit overgrowth of clostridia. Studies indicate a toxin produced by *Clostridium difficile* is one primary cause of antibiotic associated colitis. Cholestyramine and colestipol resins have been shown to bind to the toxin *in vitro*. Mild cases of colitis respond to drug discontinuance alone. Moderate to severe cases should be managed with fluid, electrolyte and protein supplementation as indicated.

When the colitis is not relieved by drug discontinuance or when it is severe, oral vancomycin is the treatment of choice for antibiotic-associated pseudomembranous colitis produced by *C. difficile*. Other causes of colitis should also be considered.

PRECAUTIONS: GENERAL Although transient elevations of BUN and serum creatinine have been observed, at the recommended dosages, the nephrotoxic potential of Rocephin is similar to that of other cephalosporins.

Ceftriaxone is excreted via both biliary and renal excretion (see Clinical Pharmacology). Therefore, patients with renal failure normally require no adjustment in dosage when usual doses of Rocephin are administered, but concentrations of drug in the serum should be monitored periodically. If evidence of accumulation exists, dosage should be decreased accordingly.

Dosage adjustments should not be necessary in patients with hepatic dysfunction, however, in patients with both hepatic dysfunction and significant renal disease, Rocephin dosage should not exceed 2 gm daily without close monitoring of serum concentrations.

Alterations in prothrombin times have occurred rarely in patients treated with Rocephin. Patients with impaired vitamin K synthesis or low vitamin K stores (e.g., chronic hepatic disease and malnutrition) may require monitoring of prothrombin time during Rocephin treatment. Vitamin K administration (10 mg weekly) may be necessary if the prothrombin time is prolonged before or during therapy.

Prolonged use of Rocephin may result in overgrowth of non-susceptible organisms. Careful observation of the patient is essential. If superinfection occurs during therapy, appropriate measures should be taken. Rocephin should be prescribed with caution in individuals with a history of gastrointestinal disease especially colitis.

CARCINOGENESIS, MUTAGENESIS, IMPAIRMENT OF FERTILITY Carcinogenesis: Considering the maximum duration of treatment and the class of the compound, carcinogenicity studies with ceftriaxone in animals have not been performed. The maximum duration of animal toxicity studies was six months. Mutagenesis: Genetic toxicology tests including the Ames test, a micronucleus test and a test for chromosomal aberrations in human lymphocytes cultured *in vitro* with ceftriaxone. Ceftriaxone showed no potential for mutagenic activity in these studies.

Impairment of Fertility: Ceftriaxone produced no impairment of fertility when given intravenously to rats at daily doses up to 586 mg/kg/day, approximately 20 times the recommended clinical dose of 2 gm/day.

PREGNANCY Teratogenic Effects: Pregnancy Category B. Reproductive studies have been performed in mice and rats at doses up to 20 times the usual human dose and have no evidence of embryotoxicity, fetotoxicity or teratogenicity. In primates, no embryotoxicity or teratogenicity was demonstrated at a dose approximately three times the human dose.

There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproductive studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Nonteratogenic Effects: In rats, in the Segment I (fertility and general reproduction) and Segment III (perinatal and postnatal) studies with intravenously administered ceftriaxone, no adverse effects were noted on various reproductive parameters during gestation and lactation, including postnatal growth, functional behavior and reproductive ability of the offspring, at doses of 586 mg/kg/day or less.

NURSING MOTHERS: Low concentrations of ceftriaxone are excreted in human milk. Caution should be exercised when Rocephin is administered to a nursing woman.

PEDIATRIC USE: Safety and effectiveness of Rocephin in neonates, infants and children have been established for the dosages described in the Dosage and Administration section.

ADVERSE REACTIONS: Rocephin is generally well tolerated. In clinical trials, the following adverse reactions, which were considered to be related to Rocephin therapy or of uncertain etiology, were observed: **LOCAL REACTIONS**—pain, induration or tenderness at the site of injection (1%). Less frequently reported (less than 1%) was phlebitis after IV administration.

HYPERSENSITIVITY—rash (17%). Less frequently reported (less than 1%) were pruritus, fever or chills.

HEMATOLOGIC—anemia (6%), thrombocytosis (51%) and leukopenia (21%). Less frequently reported (less than 1%) were anemia, neutropenia, lymphopenia, thrombocytopenia and prolongation of the prothrombin time.

GASTROINTESTINAL—diarrhea (27%). Less frequently reported (less than 1%) were nausea or vomiting, and dysgeusia.

HEPATIC—elevations of SGOT (31%) or SGPT (33%). Less frequently reported (less than 1%) were elevations of alkaline phosphatase and bilirubin.

RENAL—elevations of the BUN (12%). Less frequently reported (less than 1%) were elevations of creatinine and the presence of casts in the urine.

CENTRAL NERVOUS SYSTEM—headache or dizziness were reported occasionally (less than 1%).

GENITOURINARY—moniliasis or vaginitis were reported occasionally (less than 1%).

MISCELLANEOUS—diaphoresis and flushing were reported occasionally (less than 1%).

Other rarely observed adverse reactions (less than 0.1%) include leukocytosis, lymphocytosis, monocytosis, basophilia, a decrease in the prothrombin time, jaundice, glycosuria, hematuria, bronchospasm, serum sickness, abdominal pain, colitis, flatulence, dyspepsia, palpitations and epistaxis.

DOSEAGE AND ADMINISTRATION Rocephin may be administered intravenously or intramuscularly. The usual adult daily dose is 1 to 2 gm given once a day (or in equally divided doses twice a day) depending on the type and severity of the infection. The total daily dose should not exceed 4 grams.

For the treatment of serious miscellaneous infections in children, other than meningitis, the recommended total daily dose is 50 to 75 mg/kg (not to exceed 2 grams), given in divided doses every 12 hours.

Generally, Rocephin therapy should be continued for at least two days after the signs and symptoms of infection have disappeared. The usual duration is 4 to 14 days, in complicated infections longer therapy may be required.

In the treatment of meningitis, a daily dose of 100 mg/kg (not to exceed 4 grams), given in divided doses every 12 hours, should be administered with or without a loading dose of 75 mg/kg.

For the treatment of uncomplicated gonococcal infections, a single intramuscular dose of 250 mg is recommended.

For prophylactic use (surgical prophylaxis), a single dose of 1 gm administered ½ to 2 hours before surgery is recommended.

When treating infections caused by *Streptococcus pyogenes*, therapy should be continued for at least ten days.

No dosage adjustment is necessary for patients with impairment of renal or hepatic function, however, blood levels should be monitored in patients with severe renal impairment (e.g., dialysis patients) and in patients with both renal and hepatic dysfunctions.

HOW SUPPLIED: Rocephin (ceftriaxone sodium/Roche) is supplied as a sterile crystalline powder in glass vials and piggyback bottles. The following packages are available:

Vials containing 250 mg equivalent of ceftriaxone. Boxes of 10 (NDC 0004 1962-01).

Vials containing 500 mg equivalent of ceftriaxone. Boxes of 10 (NDC 0004 1963-01).

Vials containing 1 gm equivalent of ceftriaxone. Boxes of 10 (NDC 0004 1964-01).

Piggyback bottles containing 1 gm equivalent of ceftriaxone. Boxes of 10 (NDC 0004 1964-03).

Vials containing 2 gm equivalent of ceftriaxone. Boxes of 10 (NDC 0004 1965-01).

Piggyback bottles containing 2 gm equivalent of ceftriaxone. Boxes of 10 (NDC 0004 1965-03).

Not pharmacy containers, containing 10 gm equivalent of ceftriaxone. Boxes of 1 (NDC 0004 1971-01).

Rub a Dub Dub, Two Bugs in the Tub

Paul R. Becherer, M.D.

While a whirl in the whirlpool and a dip in the pool may be refreshing, the hazards may involve more than a temporary pruning. Physicians should be aware of the two increasingly recognized entities of *Pseudomonas* folliculitis and *Mycobacterium marinum* skin infections.

Pseudomonas auruginosa has the unique capability to fix nitrogen and utilize carbon dioxide dissolved in water, allowing it to replicate even in distilled water. This characteristic, as well as the organism's ability to tolerate chlorine and elevated temperatures, makes it well suited for environments such as swimming pools, whirlpools, saunas, physical therapy pools and waterslides, which have all been associated with outbreaks of folliculitis. High water temperature, water turbulence, aeration, heavy bather load, long exposure, tight clothing and possibly young age may contribute to the risk of infection.

Approximately 48 hours (range, 8 hours to 5 days) after exposure, a papular to papulopustular rash develops on any hair-bearing area, with particular predilection for the buttocks, axillae, hips and lateral trunk. This rash may be confused with insect bites, allergic reactions, contact dermatitis, hives, impetigo, or scabies. Associated symptoms have included low grade fever, headache, malaise, and myalgias as well as pharyngitis, external otitis, and mastitis, and occasional nausea and vomiting. Generally considered to be self-limiting, lasting several days to weeks, the infection can occasionally proceed to chronic abscess formation. Therapy is not warranted as the bacteria are rapidly cleared from the skin by neutrophils with the inflammation being related to exotoxin production. Steroids seem to exacerbate the rash, leading to generalization.

Mycobacterium marinum is also associated with swimming pools, as well as with tropical fish tanks and marine-related abrasions. Most commonly seen along the extrem-

ities, the infection appears as a crop of papules at the site of trauma with frequent progression to shallow ulcers or scab formation. Occasionally sporotrichoid nodules may develop. The terms "swimming pool granuloma" and "fish tank granuloma" are descriptive in light of the histological appearance of minimally caseating granulomata with occasional organisms. While the organisms may be seen in the exudate or biopsy material, culture of the bacterium requires alerting the laboratory that *Mycobacterium marinum* is in the differential such that the specimen can be cultured at 30° C.

In one study, 16 out of 21 patients had greater than 10 mm of induration to PPD-Platy (*M. marinum*), and 14 out of 20 with no previous tuberculosis exposure had a similar reaction to PPD-S (*M. tuberculosis*). Therapeutic trials for "swimming pool granuloma" have been complicated by the common occurrence of spontaneous remission. Intervention has included excision of the lesion, local heat, electrodesiccation, and chemotherapy. Rifampin plus ethambutol is probably the treatment of choice, particularly in advanced disease, with three weeks of doxycycline or trimethoprim plus sulfamethoxazole being reserved for minor infections. ■

"High Quadriplegia— The Ultimate Challenge"

Plan to attend:

**A two-day symposium
at Colony Square
Atlanta**

April 7-8, 1988

Registration: \$225

Symposium
Co-Chairmen

David F. Apple, Jr., M.D.
Medical Director

Donald P. Leslie, M.D.
Medical Director
High Quadriplegia Program

A medical symposium addressing the acute and rehabilitative care of the C-1 through C-4 high quadriplegic. Hosted by Shepherd Spinal Center in Atlanta, now the nation's largest dedicated spinal cord injury hospital. Issues to be investigated include: medical, psychosocial and high tech approaches to care and rehabilitation. Special emphasis on ventilator weaning, the interdisciplinary care approach, phrenic nerve pacer implants and community reintegration.

Symposium Preview:

High Quadriplegics: They Can Go Home Again

With high quadriplegics surviving at unprecedented rates, quality of life issues and discharge planning are of paramount importance from the first

day of admission to the specialty setting. The philosophy of treatment at SSC will be covered, including the referring physician's role in long-term medical management.

Medical Overview: Care of the High Quadriplegic

The potential for complications such as deep vein thrombosis, stress ulceration, decubitus, pneumonia, urinary tract infections and sepsis poses a serious threat to high quadriplegic patients. Prevention strategies, the benefits of early mobilization of ventilator dependent patients and medical management of complications are covered.

Ventilator Weaning

All high quadriplegics at Shepherd Spinal Center are evaluated to determine their candidacy for phrenic nerve pacer implants and their potential for weaning from mechanical ventilation. The pulmonary evaluation studies performed at SSC and protocols for weaning are included.

Panel and Concurrent Session Topics:

- Pulmonary Issues
- Social Work: Discharge Planning, Peer Support, Sexuality
- The Therapeutic Value of Sensory Experience
- The Biofeedback Program at SSC
- Ventilator Home Care
- Focus On: Phrenic Pacer Implantation
- Departmental Presentations by O.T., P.T., Recreation Therapy, Social Work, Respiratory Care, Education, Nutritionists
- Emphasis on specialized equipment

For Physicians Only:

Grand Rounds at Shepherd Spinal Center

REGISTRATION IS LIMITED. Reserve your space today, by sending a check for \$225, payable to Shepherd Spinal Center, to: Lesley M. Hudson, Symposium Registrar, Shepherd Spinal Center, 2020 Peachtree Road, N.W., Atlanta, GA 30309. Confirmations of early registrations and a symposium information packet will be mailed in October.

Case Study: Larry McAfee

Diagnosis: C-1 Complete

Prognosis: Promising

Contact the Admissions Office for routine information. A physician is on 24-hour call to assist in emergency arrangements.

When 28 year-old Larry McAfee was brought to Shepherd Spinal Center as a result of a motorcycle accident in late 1985, he was classified as a C-1 complete spinal cord injury. He was suffering from severe burns on his right ankle, massive atelectasis, pneumothorax and pneumonia. Paralyzed instantly at the first cervical vertebrae below the brain stem, he required mechanical ventilation for breathing.

The road to a meaningful quality of life has been a long one for Larry, requiring intensive medical care, rehabilitation, counseling—and Larry's own unsinkable spirit.

We couldn't promise Larry miracles, but we could promise him the care of the largest rehabilitation hospital in the nation specializing in paralyzing spinal cord disorders, Shepherd Spinal Center in Atlanta. With the help of various adaptive devices and skilled attendants, it is possible for Larry to live independently

in an apartment since his discharge from Shepherd. He now actively pursues his goal of a career as a computer programming consultant.

At Shepherd Spinal Center, our ultimate challenge is to assist patients like Larry in a comprehensive High Quadriplegia Program, (C 1-4). We involve referring physicians in all aspects of discharge planning for follow-up medical supervision with the hope that patients like Larry will go home again.

Your patients count on you. Accept the challenge and work with us...for them.

The Georgia Regional Spinal Cord Injury Center/Fully Accredited by CARF and JCAH/Designated "Model Spinal Cord Injury Program" by U.S. Dept. of Ed./Now offering a comprehensive Spina Bifida Program/Nation's Largest Dedicated Spinal Cord Injury and Disease Treatment Facility.

CARAFATE[®]
(sucralfate)

BRIEF SUMMARY

CONTRAINDICATIONS

There are no known contraindications to the use of sucralfate.

PRECAUTIONS

Duodenal ulcer is a chronic, recurrent disease. While short-term treatment with sucralfate can result in complete healing of the ulcer, a successful course of treatment with sucralfate should not be expected to alter the post-healing frequency or severity of duodenal ulceration.

Drug Interactions: Animal studies have shown that the simultaneous administration of CARAFATE with tetracycline, phenytoin, or cimetidine will result in a statistically significant reduction in the bioavailability of these agents. This interaction appears to be nonsystemic in origin, presumably resulting from these agents being bound by CARAFATE in the gastrointestinal tract. The bioavailability of these agents may be restored simply by separating the administration of these agents from that of CARAFATE by two hours. The clinical significance of these animal studies is yet to be defined.

Carcinogenesis, Mutagenesis, Impairment of Fertility: No evidence of drug-related tumorigenicity was found in chronic oral toxicity studies of 24 months' duration conducted in mice and rats at doses up to 1 gm/kg (12 times the human dose). A reproduction study in rats at doses up to 38 times the human dose did not reveal any indication of fertility impairment. Mutagenicity studies have not been conducted.

Pregnancy: Pregnancy Category B. Teratogenicity studies have been performed in mice, rats, and rabbits at doses up to 50 times the human dose and have revealed no evidence of harm to the fetus due to sucralfate. There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Nursing Mothers: It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when sucralfate is administered to a nursing woman.

Pediatric Use: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

Adverse reactions to sucralfate in clinical trials were minor and only rarely led to discontinuation of the drug. In studies involving over 2,500 patients, adverse effects were reported in 121 (4.7%). Constipation was the most frequent complaint (2.2%). Other adverse effects, reported in no more than one of every 350 patients, were diarrhea, nausea, gastric discomfort, indigestion, dry mouth, rash, pruritus, back pain, dizziness, sleepiness, and vertigo.

DOSAGE AND ADMINISTRATION

The recommended adult oral dosage for duodenal ulcer is 1 gm four times a day on an empty stomach.

Antacids may be prescribed as needed for relief of pain but should not be taken within one-half hour before or after sucralfate.

While healing with sucralfate may occur during the first week or two, treatment should be continued for 4 to 8 weeks unless healing has been demonstrated by x-ray or endoscopic examination.

HOW SUPPLIED

CARAFATE (sucralfate) 1-gm pink tablets are supplied in bottles of 100 and in Unit Dose Identification Paks of 100. The tablets are embossed with MARION/1712.

Issued 3/84

Another patient benefit product from

Ulcer therapy that won't yield, even to smoking

What do you do for duodenal ulcer patients who should stop smoking, but won't? Both cimetidine¹ and ranitidine² have been shown less effective in smokers than nonsmokers.

Choose CARAFATE® (sucralfate/Marion). Two recent studies show Carafate to be as effective in smokers as nonsmokers.^{3,4} A difference further illustrated in a 283-patient study comparing sucralfate to cimetidine⁵:

Ulcer healing rates:
(at four weeks of therapy)⁵

Sucralfate:

All patients	79.4%
Smokers	81.6%*

Cimetidine:

All patients	76.3%
Smokers	62.5%

*Significantly greater than cimetidine smoker group ($P < .05$).

Carafate has a unique, nonsystemic mode of action that enhances the body's own ulcer healing ability and protects the damaged mucosa from further injury.

When your ulcer patient is a smoker, prescribe the ulcer medication that won't go up in smoke: safe, nonsystemic Carafate.

Nothing works like

CARAFATE®
sucralfate/Marion

The appearance of these tablets is a trademark of Ayerst Laboratories.

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION AND PATIENT INFORMATION, SEE PACKAGE CIRCULARS.)

PREMARIN® Brand of conjugated estrogens tablets, USP

PREMARIN® Brand of conjugated estrogens Vaginal Cream, in a nonliquefying base

1 ESTROGENS HAVE BEEN REPORTED TO INCREASE THE RISK OF ENDOMETRIAL CARCINOMA. Three independent, case-controlled studies have reported an increased risk of endometrial cancer in postmenopausal women exposed to exogenous estrogens for more than one year. This risk was independent of the other known risk factors for endometrial cancer. These studies are further supported by the finding that incidence rates of endometrial cancer have increased sharply since 1969 in eight different areas of the United States with population-based cancer reporting systems, an increase which may be related to the rapidly expanding use of estrogens during the last decade. The three case-controlled studies reported that the risk of endometrial cancer in estrogen users was about 4.5 to 13.9 times greater than in nonusers. The risk appears to depend on both duration of treatment and on estrogen dose. In view of these findings, when estrogens are used for the treatment of menopausal symptoms, the lowest dose that will control symptoms should be utilized and medication should be discontinued as soon as possible. When prolonged treatment is medically indicated, the patient should be reassessed on at least a semi-annual basis to determine the need for continued therapy. Although the evidence must be considered preliminary, one study suggests that cyclic administration of low doses of estrogen may carry less risk than continuous administration, it therefore appears prudent to utilize such a regimen. Close clinical surveillance of all women taking estrogens is important. In all cases of undiagnosed persistent or recurring abnormal vaginal bleeding, adequate diagnostic measures should be undertaken to rule out malignancy. There is no evidence at present that "natural" estrogens are more or less hazardous than "synthetic" estrogens at equi-estrogenic doses.

2 ESTROGENS SHOULD NOT BE USED DURING PREGNANCY

The use of female sex hormones, both estrogens and progestogens, during early pregnancy may seriously damage the offspring. It has been shown that females exposed in utero to diethylstilbestrol, a nonsteroidal estrogen, have an increased risk of developing, in later life, a form of vaginal or cervical cancer that is ordinarily extremely rare. This risk has been estimated as not greater than 4 per 1,000 exposures. Furthermore, a high percentage of such exposed women (from 30% to 90%) have been found to have vaginal adenosis, epithelial changes of the vagina and cervix. Although these changes are histologically benign, it is not known whether they are precursors of malignancy. Although similar data are not available with the use of other estrogens, it cannot be presumed they would not induce similar changes. Several reports suggest an association between intrauterine exposure to female sex hormones and congenital anomalies, including congenital heart defects and limb-reduction defects. One case-controlled study estimated a 4.7-fold increased risk of limb-reduction defects in infants exposed in utero to sex hormones (oral contraceptives, hormone withdrawal tests for pregnancy, or attempted treatment for threatened abortion). Some of these exposures were very short and involved only a few days of treatment. The data suggest that the risk of limb-reduction defects in exposed fetuses is somewhat less than 1 per 1,000. In the past, female sex hormones have been used during pregnancy in an attempt to treat threatened or habitual abortion. There is considerable evidence that estrogens are ineffective for these indications, and there is no evidence from well-controlled studies that progestogens are effective for these uses. If PREMARIN is used during pregnancy, or if the patient becomes pregnant while taking this drug, she should be apprised of the potential risks to the fetus, and the advisability of pregnancy continuation.

DESCRIPTION: PREMARIN (conjugated estrogens, USP) contains a mixture of estrogens, obtained exclusively from natural sources, blended to represent the average composition of material derived from pregnant mares' urine. It contains estrone, equilin, and 17 α -dihydroequilin, together with smaller amounts of 17 α -estradiol, equilin, and 17 α -dihydroequilin as salts of their sulfate esters. Tablets are available in 0.3 mg, 0.625 mg, 0.9 mg, 1.25 mg, and 2.5 mg strengths of conjugated estrogens. Cream is available as 0.625 mg conjugated estrogens per gram.

INDICATIONS AND USAGE: PREMARIN (conjugated estrogens tablets, USP): Moderate-to-severe vasomotor symptoms associated with the menopause. (There is no evidence that estrogens are effective for nervous symptoms or depression without associated vasomotor symptoms and they should not be used to treat such conditions.) Osteoporosis (abnormally low bone mass). Atrophic vaginitis. Kraurosis vulvae. Female castration. PREMARIN (conjugated estrogens) Vaginal Cream is indicated in the treatment of atrophic vaginitis and kraurosis vulvae.

PREMARIN HAS NOT BEEN SHOWN TO BE EFFECTIVE FOR ANY PURPOSE DURING PREGNANCY AND ITS USE MAY CAUSE SEVERE HARM TO THE FETUS (SEE BOXED WARNING).

Concomitant Progestin Use: The lowest effective dose appropriate for the specific indication should be utilized. Studies of the addition of a progestin for 7 or more days of a cycle of estrogen administration have reported a lowered incidence of endometrial hyperplasia. Morphological and biochemical studies of the endometrium suggest that 10 to 13 days of progestin are needed to provide maximal maturation of the endometrium and to eliminate any hyperplastic changes. Whether this will provide protection from endometrial carcinoma has not been clearly established. There are possible additional risks which may be associated with the inclusion of progestin in estrogen replacement regimens. (See PRECAUTIONS.) The choice of progestin and dosage may be important, product labeling should be reviewed to minimize possible adverse effects.

CONTRAINDICATIONS: Estrogens should not be used in women (or men) with any of the following conditions. 1. Known or suspected cancer of the breast except in appropriately selected patients being treated for metastatic disease. 2. Known or suspected estrogen-dependent neoplasia. 3. Known or suspected pregnancy (see Boxed Warning). 4. Undiagnosed abnormal genital bleeding. 5. Active thrombophlebitis or thromboembolic disorders. 6. A past history of thrombophlebitis, thrombosis, or thromboembolic disorders associated with previous estrogen use (except when used in treatment of breast or prostatic malignancy).

WARNINGS: Estrogens have been reported to increase the risk of endometrial carcinoma (see Boxed Warning). However, a recent large, case-controlled study indicated no increase in risk of breast cancer in postmenopausal women. A recent study has reported a 2- to 3-fold increase in the risk of surgically confirmed gallbladder disease in women receiving postmenopausal estrogens.

Adverse effects of oral contraceptives may be expected at the larger doses of estrogen used to treat prostatic or breast cancer or postpartum breast engorgement, it has been shown that there is an increased risk of thrombosis in men receiving estrogens for prostatic cancer and women for postpartum breast engorgement. Users of oral contraceptives have an increased risk of diseases, such as thrombophlebitis, pulmonary embolism, stroke, and myocardial infarction. Cases of retinal thrombosis, mesenteric thrombosis, and optic neuritis have been reported in oral contraceptive users. An increased risk of postsurgery thromboembolic complications has also been reported in users of oral contraceptives. If feasible, estrogen should be discontinued at least 4 weeks before surgery of the type associated with an increased risk of thromboembolism, or during periods of prolonged immobilization. Estrogens should not be used in persons with active thrombophlebitis, thromboembolic disorders, or in persons with a history of such disorders in association with estrogen use. They should be used with caution in patients with cerebral vascular or coronary artery disease. Large doses (5 mg conjugated estrogens per day), comparable to those used to treat cancer of the prostate and breast, have been shown to increase the risk of nonfatal myocardial infarction, pulmonary embolism, and thrombophlebitis. When doses of this size are used, any of the thromboembolic and thrombotic adverse effects should be considered a clear risk.

For atrophic vaginitis

PREMARIN® (conjugated estrogens)

Vaginal Cream

0.625 mg/g

Benign hepatic adenomas should be considered in estrogen users having abdominal pain and tenderness, abdominal mass, or hypovolemic shock. Hepatocellular carcinoma has been reported in women taking estrogen-containing oral contraceptives. Increased blood pressure may occur with use of estrogens in the menopause and blood pressure should be monitored with estrogen use. A worsening of glucose tolerance has been observed in patients on estrogen-containing oral contraceptives. For this reason, diabetic patients should be carefully observed. Estrogens may lead to severe hypercalcemia in patients with breast cancer and bone metastases.

PRECAUTIONS: Physical examination and a complete medical and family history should be taken prior to the initiation of any estrogen therapy with special reference to blood pressure, breasts, abdomen, and pelvic organs, and should include a Papanicolaou smear. As a general rule, estrogen should not be prescribed for longer than one year without another physical examination being performed. Conditions influenced by fluid retention, such as asthma, epilepsy, migraine, and cardiac or renal dysfunction, require careful observation. Certain patients may develop manifestations of excessive estrogenic stimulation, such as abnormal or excessive uterine bleeding, mastodynia, etc. Prolonged administration of unopposed estrogen therapy has been reported to increase the risk of endometrial hyperplasia in some patients. Oral contraceptives appear to be associated with an increased incidence of mental depression. Patients with a history of depression should be carefully observed. Pre-existing uterine leiomyomata may increase in size during estrogen use. The pathologist should be advised of estrogen therapy when relevant specimens are submitted. If jaundice develops in any patient receiving estrogen, the medication should be discontinued while the cause is investigated. Estrogens should be used with care in patients with impaired liver function, renal insufficiency, metabolic bone diseases associated with hypercalcemia, or in young patients in whom bone growth is not yet complete. If concomitant progestin therapy is used, potential risks may include adverse effects on carbohydrate and lipid metabolism.

The following changes may be expected with larger doses of estrogen:

- Increased sulfobromophthalein retention.
- Increased prothrombin and factors VII, VIII, IX, and X, decreased antithrombin 3, increased norepinephrine-induced platelet aggregability.
- Increased thyroid binding globulin (TBG) leading to increased circulating total thyroid hormone, as measured by PBI, T_4 by column, or T_4 by radioimmunoassay. Free T_4 resin uptake is decreased, reflecting the elevated TBG. Free T_4 concentration is unaltered.
- Impaired glucose tolerance.
- Decreased pregnandiol excretion.
- Reduced response to metyrapone test.
- Reduced serum folate concentration.
- Increased serum triglyceride and phospholipid concentration.

As a general principle, the administration of any drug to nursing mothers should be done only when clearly necessary since many drugs are excreted in human milk.

Long-term, continuous administration of natural and synthetic estrogens in certain animal species increases the frequency of carcinomas of the breast, cervix, vagina, and liver. However, in a recent, large case-controlled study of postmenopausal women there was no increase in risk of breast cancer with use of conjugated estrogens.

ADVERSE REACTIONS: The following have been reported with estrogenic therapy, including oral contraceptives: breakthrough bleeding, spotting, change in menstrual flow, dysmenorrhea, premenstrual-like syndrome, amenorrhea during and after treatment, increase in size of uterine leiomyomata, vaginal candidiasis, change in cervical erosion and in degree of cervical secretion, cystitis-like syndrome, tenderness, enlargement, secretion (of breasts), nausea, vomiting, abdominal cramps, bloating, cholestatic jaundice, chloasma or melasma which may persist when drug is discontinued, erythema multiforme; erythema nodosum, hemorrhagic eruption, loss of scalp hair, hirsutism; steepening of corneal curvature, intolerance to contact lenses, headache, migraine, dizziness, mental depression, chorea, increase or decrease in weight, reduced carbohydrate tolerance, aggravation of porphyria, edema, changes in libido.

ACUTE OVERDOSEAGE: May cause nausea, and withdrawal bleeding may occur in females.

DOSEAGE AND ADMINISTRATION:

PREMARIN® Brand of conjugated estrogens tablets, USP

1 Given cyclically for short-term use only For treatment of moderate-to-severe vasomotor symptoms, atrophic vaginitis, or kraurosis vulvae associated with the menopause (0.3 mg to 1.25 mg or more daily). The lowest dose that will control symptoms should be chosen and medication should be discontinued as promptly as possible. Administration should be cyclic (eg, three weeks on and one week off). Attempts to discontinue or taper medication should be made at three- to six-month intervals.

2 Given cyclically. Osteoporosis. Female castration. Osteoporosis—0.625 mg daily. Administration should be cyclic (eg, three weeks on and one week off). Female castration—1.25 mg daily, cyclically. Adjust upward or downward according to response of the patient. For maintenance, adjust dosage to lowest level that will provide effective control.

Patients with an intact uterus should be monitored for signs of endometrial cancer and appropriate measures taken to rule out malignancy in the event of persistent or recurring abnormal vaginal bleeding.

PREMARIN® Brand of conjugated estrogens Vaginal Cream

Given cyclically for short-term use only For treatment of atrophic vaginitis or kraurosis vulvae.

The lowest dose that will control symptoms should be chosen and medication should be discontinued as promptly as possible.

Administration should be cyclic (eg, three weeks on and one week off).

Attempts to discontinue or taper medication should be made at three- to six-month intervals.

Usual dosage range: 2 g to 4 g daily, intravaginally, depending on the severity of the condition.

Treated patients with an intact uterus should be monitored closely for signs of endometrial cancer and appropriate diagnostic measures should be taken to rule out malignancy in the event of persistent or recurring abnormal vaginal bleeding.

Physicians and Providers

Robert A. Gutman, M.D.

On the chart of a recently hospitalized patient was a note written by a medical doctor. It was titled: "(name of an insurance organization) primary provider." I was disturbed by this self description. Why should a graduate of a medical school and of a post-graduate program call himself a "provider" (defined by Webster, 1977 as "... one who provides")? Instinctively, I would have called him a physician ("... a person skilled in the art of healing ... exerting a salutary influence").

My first reaction was annoyance at the modern penchant to use jargon apparently designed to achieve a chummy relationship between the "provider" and the "consumer," another recent addition to our terminology. But language has an insidious ability to influence as well as reflect thought. At issue is the compelling possibility that this individual's concept of his role differs from mine; he may not be comfortable in the role of physician. He may really see himself largely in the new role of provider.

I acknowledge that the world needs providers and possibly even providers with medical degrees. These are the people who "provide" access to the medical care system; the people who "provide" sound sensible advice to the walking worried and the potentially ill, the employed enrollees in capitated medical plans whose managers confess that they can't afford sick people. These capitated plans call themselves "Health Maintenance Organizations" and often use the term "provider" when referring to their doctors. Presumably if they have picked the right providers, health really will be maintained, at least for the group at large, and costs will be reduced. Good providers should ultimately put physicians out of business.

In the meanwhile, it seems to me that employers and HMOs prefer to employ providers, while sick people prefer to have physicians. Maybe physicians care too much for sick people and cost society too much money. But which individual would feel that way when he or a member of his family is sick? Other rhetorical questions come to mind.

What becomes of the provider when his enrollee becomes a patient? I don't mean simply a pregnant enrollee or an enrollee with a fracture that will heal soon or a bad cut that can be sewn in one evening; but really truly sick with a chronic illness, with a problem that won't go away, with that gnawing, fearful, sinking feeling that life is changing and there is nobody to talk to, nobody to counsel, nobody willing to have spent the hours in preparation for these difficult moments. Having spent most of his time caring for the herd of well people and their concerns, and their need for prophylaxis, for immunization, for education, for dietary counseling, for advice on exercise, is he now prepared to be also a physician — prepared either emotionally or educationally? The medical school graduate who has been persuaded to see himself as a provider may not be able to assume the physician's mantle.

The dilemma, if not the solution, is becoming clearer. Society, when making decisions in an abstract frame, wants providers. People, acting as individuals, want physicians. Most of us see ourselves as physicians, although apparently not all of us do. I assumed that was the purpose of my education and, likely, you made the same assumption. But what of this perceived and possibly real need for providers? Can the physician assume the role of provider? Or do we need two different sorts of people graduating from medical schools?

Tradition may provide some answers. The pediatricians among us would find this discussion a little arcane. For years, they have successfully walked both paths, though they certainly never would have used the word provider to describe themselves. There are other groups and certainly many other individuals who take the same position in self assessment. Still, society's perception is that it needs to train new doctors to work for the insurance companies and for the employers in order to reduce the need for sickness care and replace it with "health care." Consequently, new money and departments for this training have arisen and grown over the last decade. This trend is no longer surprising, nor is it likely to change. But if the graduates no longer see themselves as primarily physicians, we have thrown out the baby as well. ■

From Suite 604, Central Medical Park, 2609 North Duke Street, Durham 27704.

The Names and Faces of Medicine

Francis A. Neelon, M.D.

One of the great revelations of my adult life (that is, the time long past medical school and residency and fellowship training) has been the realization that Medicine is, *in itself*, a proper subject for scholarly inquiry and study. Up until then, although no one told me so in direct terms, I had been surrounded by people who acted as though Medicine was what the holders of an M.D. degree did after they had tried and failed in a career of laboratory-based investigation. Physiology, pathology, biochemistry, molecular biology — these were the stuff of “academic medicine,” the bases of careers in understanding the human body gone askew and in the management of disease. The practice of medicine, the care of the patient, the life of the clinic were passed over; not directly slighted, but demeaned by indirection and the faintest of praise.

Despite this shortchanging of the worth of medical practice (possibly because of it), it has pleased me to slowly realize that medicine has something that none of those disciplines named above has: a genuine History. I suppose one could trace the origins of biochemistry to the putterings of the alchemists or describe how Claude Bernard began physiology. But any of those stories would be only a footnote on the pages of the history of medicine. Unfortunately many of us in medicine remain unclear about the rich traditions and unbroken lineage of clinical practice, dating as it does to the ancient Greeks and beyond. Nevertheless, all of us profit from a sense of our forebears and of what we have become from what we were. Neil Postman¹ quotes Cicero:

“To remain ignorant of things that happened before you were born is to remain a child.” for “what is a human life worth unless it is incorporated in to the lives of one’s ancestors and set in an historical context?” Then Postman adds a postscript of his own: “By ‘ancestors’ Cicero did not mean your mother’s aunt.” Amen.

When I was a student, my professors sometimes bemoaned the presence and prevalence of eponyms in clinical medicine. Now I come to sing the praises of eponyms; to glory in the histories of those individuals who donated their names to clinical signs and symptoms and phenomena. These are *our* ancestors and their “faces” are with us every day, traced on the bodies of our patients. With this issue of the *Journal*, we begin what we hope will be a regular section: *The Names and Faces of Medicine*. Dr. Lurie and I have captured the likeness of Baron Dupuytren as reflected in his “contracture” and proceeded to compile a biographical vignette about the celebrated gentleman (p. 452). We hope that you will like it and, even more, we hope to impel some of you to contribute something of your own.

If the spirit moves you, get a photo of the clinical “face” and tell us about the name that goes with it. Working together we should be able to compile a veritable gallery of portraits of the Truly Great — those who have gone before us and have “left the vivid air signed with their honour.” ■

Should Homeopathy Be Reconsidered?

J.K. Crellin, M.D., Ph.D.

North Carolina is unwittingly the focus of international attention following a recent action of the state's Medical Board of Examiners. The Board suspended the medical licence of Asheville physician Dr. George Guess for practicing homeopathy. According to the decision, Dr. Guess contravened the North Carolina General Statute Section 90-14 (a) 6: failure to conform to the "standards of acceptable and prevailing practice in the state of North Carolina." That is because of Dr. Guess' use of homeopathic medicines "prepared from substances including, but not limited to, moss, the nightshade plant and various other animal, vegetable and mineral substances."

In this article I am not concerned with such specific points raised by the decision as whether or not the statute, when enacted, was intended to eliminate homeopathy, or if the decision protects the public; after all, non-medically qualified persons continue to practice homeopathy in the state. Rather, I shall consider various points raised in debates over homeopathic medicine, which, after nearly two hundred years, is little understood and widely viewed as quackery.

Undoubtedly, questions about homeopathy in North Carolina will soon emerge into the limelight in consequence of continuing Court action over the Medical Board's decision on Dr. Guess. Consideration may well be given to concerns that North Carolina is not allowing patients the same free choice as is now available in other states, and in other countries such as Britain, where the National Health Service pays for homeopathic care. There, as elsewhere, substantial numbers of physicians have, like Dr. Guess, recently added homeopathy to their regular medical armamentarium. There is much concern among physicians and health administrators over the efficacy of homeopathic medicine and over its standards in comparison to those of regular practice.

Efficacy and the Historical Perspective

Arguments favoring homeopathic medicine in recent refer-

enced medical and pharmaceutical journals generally rest on the existence of an historical "pedigree" and on evidence from double blind, clinical trials.

The support from history rests on the persistence of certain concepts once readily found in regular medicine and now current in homeopathy, for instance, that one disease can cure another. In addition, such historical figures as Hippocrates and Paracelsus are viewed as forerunners of homeopathy because of their promotion of this and other concepts. Yet, in the absence of detail and evidence that the concepts are really common to both homeopathic and regular medical practice, historical "pedigrees" convince few skeptics.

Discussions on the founder of homeopathy, Samuel Hahnemann (1753-1843), also fail to influence skeptics, partly because few accounts make clear his firm grounding in eighteenth-century medical ideas from which he developed basic homeopathic concepts. One such concept is his "law of similars," which asserts that small doses of a drug are therapeutically valuable for those symptoms produced by toxic doses of the same substance. Hahnemann's demand for first-hand observations of disease and treatment, his critical assessments of the "healing power of nature," and his sympathy with concepts of vitalism were all concerns conspicuous among his contemporaries. Likewise, his criticism of existing regular medical practices found much agreement among regular physicians, even though, as homeopathy became established and aroused opposition, this criticism was seemingly more self-serving than objective. All this suggests that to dismiss Hahnemann as a quack is an over-simplification. Although his empiricism was further along the spectrum toward radical skepticism than were the philosophies of most of his contemporaries, it rested on acceptable scientific methods. Critics of homeopathy can gather much understanding of its aims and ideals from Hahnemann's life and aspirations.

Many who see Hahnemann as a practitioner of his time still dismiss present-day homeopathic practice. It is now viewed as anachronistic and out of keeping with today's scientific medicine. Hahnemann's own criticism of those who concoct "so-called systems" out of "vagaries and hypotheses" is now applied to "outdated" notions of vi-

From the Department of Community and Family Medicine, Duke University Medical Center, P.O. Box 3702, Durham 27710.

talism employed by homeopaths to rationalize the use of infinitesimally small doses of drugs. Those who consider homeopathy from the "cultural norm" of modern science generally find, more than anything else, the impossibility of accepting the idea that homeopathic medicines, particularly in dilutions greater than 10^{-24} , can be effective. After all, according to Avagadro's Law, the number of molecules in one gram molecule of substance is 6.023×10^{23} , and hence there are no molecules left in many homeopathic medicines. The view that drugs leave "imprinted" information, like a template, in the form of energy on water molecules is rarely accepted outside homeopathy, despite interest in rationalizations of this based on physical chemistry.

Even apart from the conceptual difficulty over homeopathic dilutions of drugs, numerous physicians express hostility toward the botanical and animal products employed. They see them as "obsolete." Other observers view this as overly critical. Although one might find fault with the fact that homeopathic practitioners do not employ conventional pharmacological classifications or regular therapeutic practices, one should appreciate that innumerable plant remedies were central to regular medicine until just about fifty years ago or so. Furthermore, many such remedies disappeared not because they were considered ineffective, but because they were replaced by more "modern" chemical remedies. In fact, our knowledge of the precise action of most herbs is limited, and using them to characterize homeopathy as archaic — irrespective of its efficacy — is open to charges of inappropriate or illogical comparisons. In a similar vein, should homeopathy be dismissed on the grounds that even if it was useful when regular medicine was more "primitive," it is now valueless? This either ignores, or dismisses as anecdotal, countless documented cures and numerous assessments that "clearly it works: millions of people the world over are treated homeopathically every day." Is there validity to the clinical data, independent of the vitalist theory that upsets so many physicians? Homeopathic practitioners who have long answered this positively on the basis of clinical experience now appreciate that more rigorous evidence is necessary if homeopathy is to gain wider acceptance. They recognize not only the modern reliance of therapy on double blind, clinical trials, but also the tendency to dismiss any therapeutic effect that does not have a plausible pharmacological explanation as "mere placebo."

Clinical Trials

Double blind, clinical trials of homeopathic medicines have been published recently in regular rather than homeopathic medical journals. Three, in the *Lancet* and the *British Journal of Clinical Pharmacology*, have aroused much interest, though more in terms of questions raised than definite conclusions provided. A 1980 paper argued that homeopathic treatment significantly improved rheumatoid arthritis compared with placebo; a 1983 trial of *Rhus tox* of 6x dilution

showed no significant difference compared with placebo in the management of osteoarthritis, and a 1986 study on treating allergies concluded that homeopathic preparations of pollen were significantly better than a placebo. Responses by the medical profession to these papers — and to trials published in German regular medical journals — have raised many questions over experimental methodology. The 1983 paper on treating osteoarthritis has been widely used to criticise homeopathy without reference to the authors' dismay over "overreaction on all sides to its findings." Generalizations, they say, cannot be extended to cover homeopathic medicine in general: "the most important lesson (from the study) is that a double blind crossover trial of short duration using a single potency of a remedy for local factors is unlikely to be a fruitful method of seriously studying homeopathic medicine."

Undoubtedly, many studies are needed to determine the precise roles of specific drugs and of placebo action within homeopathic treatment. There is little doubt that placebo action is at least as powerful, if not more, in homeopathic as in regular medicine, especially since homeopathic practitioners provide more practitioner-patient contact time. Additionally, the "alternative" status of homeopathy encourages among many patients the sort of conviction, faith really, that promotes placebo responses.

That various features of homeopathy encourage placebo action arouses antipathy among physicians who consider deliberate encouragement of placebo response to be unethical. Others, however, perhaps more conscious of the prominent role of placebo action within regular medicine, disagree on the basis that a favorable outcome for a patient justifies the means. Nevertheless, many who take this open-ended position still recognize that maintenance of appropriate standards of care must be constant.

Standards of Care

Whether or not physicians maintain an open mind toward homeopathy — at least until more experimental studies have been undertaken — may depend on the existence of standards uniformly applied and comparable to the standards of regular medicine. Any discussion about standards (quality) of medical care raises diverse opinions about appropriate methods of assessment, and certainly with homeopathy it is important to seek an evenhandedness in assessment.

Standards are often applied in a double-edged manner to all forms of alternative medicine, more often than to regular practice. If one assessment — the measurement of the outcome of illness — is satisfactory, then an alternative approach — assessment of the process by which care is given — is commonly found wanting; or vice versa. Additionally, while the innumerable, well-documented variations within regular medical care (often called practice style factors) are usually embraced, even if frowned upon, within "acceptable standards," the same latitude is not given to alternative

practices. One reason is that diverse practice style factors are justified as an art if not as a science, a luxury not afforded to homeopathy. If there is a lack of consensus over data or its interpretations, regular physicians respond — perhaps even with an extravagant use of antibiotics — according to the “art of medicine.”

Even apart from such inconsistencies, considerations of standards in homeopathy are complicated by the diversity of practitioners. These include those with regular medical qualifications, some who enter the field through core training in naturopathy or anthroposophy, and others with little formal training. In fact, assessments of homeopathy have long been frustrated by variable practices. Nowadays substantial differences exist between homeopathy in America and in France, where more aggressive therapy is practiced. While some consider that variation in homeopathic practice reflects openness and self-assessment and is a strength, variation has undermined the search for a consistent body of empirical data. Organizations such as the American Institute of Homeopathy encourage standards with respect to practice procedures, but rarely in the context of relationships between homeopathy and regular medical practices, or risks and benefits for patients.

Yet even without clear guidelines, risk-benefit assessment is routine among homeopathic practitioners with regular medical qualifications. They examine closely the merits of offering either homeopathic or regular medical care. (“Safe drugs may be dangerous drugs if they are ineffective in treating serious disease.”) A particular concern is sequelae from Group A β -hemolytic streptococcal pharyngitis or sore throat. Although the availability of rapid tests for streptococcal antigen, albeit not foolproof, is simplifying management, homeopathic physicians are always conscious of risks of withholding antibiotics. Decisions on whether antibiotics are to be prescribed are based on evaluations of past and present medical history, physical examination (recognizing that many streptococcal throat infections are asymptomatic or very mild), and laboratory tests. All the data are reviewed in the light of such factors as the recent marked decline in the incidence of rheumatic fever among certain socioeconomic levels, the infrequency of streptococcal infections in children under the age of three, at least in the United States, and that the risk of glomerulonephritis from not treating a sore throat is only slightly higher than when antibiotics are given. Decisions also take into account the patient’s commitment to homeopathic treatment and the patient’s fear of antibiotics because of side effects not found with homeopathic medicines. In fact, a positive feature in deciding on homeopathic or regular medical treatment is that patients are actively involved, which can be particularly valuable for the therapeutic relationship. A homeopathic physician, too, commonly alters treatment if a condition worsens, and may then prescribe antibiotics with the recognition that brief delays in, say, managing a streptococcal pharyngitis or sore throat do not put the patient at extra risk from complications.

Assessing the effectiveness of homeopathy by measurement of outcome presents as many difficulties as assessing procedures, in part because of the lack of precise statistics from homeopathic physicians. Further, it is clear that there are self-imposed limits among many homeopaths, such as a reluctance, if not refusal, to treat cancer and acute medical conditions.

Should We Reconsider Homeopathy?

Should we reconsider homeopathy? Many physicians answer this affirmatively on the grounds that new insights into neuroregulatory mechanisms (peptides, endorphins) may provide a more acceptable theoretical framework than vitalism; others are awaiting the outcome of more double blind, clinical trials, and some — probably few — believe that since homeopathy is a safe form of care (no side-effects), it provides a service for patients who obtain no relief from regular practice. If the gist of this article encourages a sense that homeopathy merits consideration by physicians, it should be stressed that serious concerns exist, even within the ranks of homeopathy.

One concern is that while those who critically examine and combine regular and homeopathic medicine may be in a position, like their forerunners in the nineteenth century, to encourage a widespread critical reevaluation of some fashions in regular medical therapy, other homeopathic practitioners with limited training may be creating unnecessary risks for patients. Without first-hand experience with the approaches of regular medicine, difficulties are considerable in evaluating the risks and benefits of various therapeutic approaches.

Another concern is the quality of homeopathic medicines. An essential feature in preparing these is enhancing or “potentising” the effects of very dilute solutions, in which case impurities may be similarly “potentised” and interfere with efficacy. Indeed, contamination is a very real problem, one recognized by homeopathic practitioners but only partially dealt with. Standards are established, but they are not always followed, and as a result some companies have better reputations than others for the quality of their products. It is unclear how much the variable quality of medicines — let alone the deliberate fraudulence of some — hinders accurate assessment of homeopathic practices. Such issues are especially relevant to homeopathic medicines employed for self-treatment; indeed many question whether or not self-treatment is compatible with the philosophy of and approach to prescribing homeopathic remedies for a symptom complex. On the other hand, homeopaths see much self-treatment as a form of first-aid and stress that if there is not rapid improvement professional advice is needed.

Reconsidering homeopathy can take many directions. For instance, does it offer quantifiable therapeutic effects? Does it consider adequately the risks and benefits? How much of

a social and medical role does it have as an alternative or a complement to regular medical practices?

It is a trite truism to say that there are pros and cons to each issue; nevertheless, ideally, the medical profession should appreciate these, if only because homeopathy is pursued and sampled by many patients and is perhaps regaining the social force it once had. Physicians may feel that in the past the medical establishment controlled homeopathy with concerted policies, and that it can do so again. Maybe, but careful consideration has to be given to the changed circumstances of medicine and the public attitudes toward it.

"If I Grow Up..."

Every child likes to play "grown-up", but no child should have to suffer the very grown-up symptoms of childhood cancer.

At St. Jude Children's Research Hospital, we're fighting to put an end to this senseless loss, and we're working toward a day when no innocent "grown-up" will lose her life to cancer.

To find out how you can help, write to St. Jude, 505 N. Parkway, Memphis, TN 38105, or call 1-800-238-9100.

How More Than 2000 Doctors Have Eased The Pain Of Managing A Practice.

If your practice is like a lot of others, you often spend more time on office problems than on the health problems of your patients.

Our one easy-to-use, fully-integrated computer system can take care of billing, provide financial updates, help you market your practice. And give you more time to do what you went to medical school for.

"Medic continues to be the best system for our clients"

Thomas Booth, president of The PM Group, Battle Creek, Michigan

When this nationally-recognized medical consulting firm recommends a product to their clients, you know it's been carefully scrutinized. After reviewing over 60 medical systems, The PM Group judged our system to be the best. And the one that offers the best support and service.

"It's helped our cash flow tremendously"

Mike Griga, general manager of Mayfield Neurological Institute, Cincinnati, Ohio

Changing the billing system from once a month to once a week is just one way Medic has improved the bottom line of the nation's largest neurosurgery group. Our system can ease the process of sending

statements and reduce the number of uncollected bills. Plus, our easy-to-understand printouts help you keep better track of your financial condition.

"When lightning knocked out our system, Medic worked through the night to get it up and running quickly"

Doug Speak, assistant administrator of Suncoast Medical Clinic, St. Petersburg, Florida

We'll do whatever it takes to keep your system working. Day or night. We have a toll-free STAT line to handle questions and problems. And there's a STAT PLUS line from our support center to your system for software updates and diagnoses.

So if you're looking to increase the efficiency, productivity and profitability of your practice, take a look at the Medic Computer System.

Over 2000 physicians in more than 600 practices throughout the U.S. are calling it a minor medical miracle.

6601 Six Forks Road, Suite 150
Raleigh, North Carolina 27609

Dupuytren's Contracture:

an idiopathic flexion deformity of the hand caused by retractile sclerosis of the palmar aponeurosis and comprised of two types of lesions, nodules and retractile bands (shown above in three photos of two patients with typical Dupuytren's contracture). It affects any or all of the fingers of the hand, but spares the thumb. Only the retractile bands cause severe digital flexion. Severe cases can be treated by fasciotomy or fasciectomy.

Baron Guillaume Dupuytren was the pre-eminent surgeon of his day. He is remembered to us in the name of the disease he described in 1831, but his life and times were of a rich texture and make an interesting study. He was born a subject of the King in 1777 and died in 1835, having lived through two revolutions, a republic, an empire, and two royal restorations, and having risen to the pinnacle of the surgical profession.

The eighth of nine children, as a young man Dupuytren wanted to join the army, but his father (a lawyer) insisted that he become a surgeon. He enrolled at Limoges and transferred to Paris where he brought limitless energy to his studies. Although he had become ill on first exposure to the dissecting room, he soon developed a passionate love for anatomy. In 1802 Dupuytren was named second surgeon at the Hotel Dieu, largest of the French hospitals, and, in 1808, joint chief-surgeon under Pelletan, a tenure marked by conflict. The tension created by new advances which Dupuytren embraced and old traditions to which Pelletan clung was exacerbated by their ill-matched personalities. Pelletan was staid and unhurried, even indolent; Dupuytren ambitious, energetic, and infinitely self-confident. Pelletan insisted on being present at Dupuytren's operations and forbade him to try new techniques; Dupuytren, in turn, exercised his right to attend Pelletan's ward rounds where our Baron often intimidated his chief with silence or superior knowledge.

The tension lasted until Pelletan's departure in 1815, whereupon Dupuytren became chief surgeon. The "Age of Dupuytren" had begun, and would continue until his death in 1835. His lectures and extensive practice made him the leading surgeon in France, if not all Europe. His list of surgical firsts, before the discovery of ether anesthesia, in-

cludes: excision of the lower jaw (1812); successful treatment of aneurysm by compression (1818); treatment of wry neck by sternocleidomastoid section (1822); and successful ligation of the external iliac (1815) and subclavian arteries (1819). His most enduring contributions are in surgical pathology, including descriptions of Dupuytren's fracture of the distal fibula (1819) and Dupuytren's contracture, for which he devised an operation (1832). As his fame grew, so too did his practice and his fortune. He served as surgeon to Louis XVIII, who made him a baron, to Charles X, successor to Louis and to the Baron James de Rothschild. From his humble beginnings Dupuytren amassed a fortune of four million francs.

Dupuytren ruled the Hotel Dieu with an iron hand. Customarily gentle with his patients, he was demanding and punitive with his students, who spoke only when spoken to. Any opposition or interference evoked an explosion of anger from which no one was safe. A poor peasant woman once incautiously entered the operating room where he was preparing to amputate her child's leg. Dupuytren drove her from the room with a "coup de pied dans le derriere."

Dupuytren's health began to fail in 1833 when, during a lecture, he felt his right cheek droop and found that he could not completely lower his right eyelid. The astute diagnostician did not mistake his own evolving stroke, but the proud chief-surgeon could not let it interfere with his duties. Resting his cheek on his hand so that no one else would notice, he finished the lecture, but he did not recover his health.

In January 1835, he developed an empyema. He considered operation but decided that death was his destiny. He preferred God's hand to the surgeon's, and died twelve days after his diagnosis. ■

Run for the Roses

KENNETH J. WELCH

A couple of years ago as I watched the graduating students receive their medical degrees during the convocation ceremony of our medical school, I began to think about the Kentucky Derby which was to be run the next day. It occurred to me that many parallels could be drawn between that magical race and the milieu of medical education.

My mind raced with the students marching across the stage accepting their degrees as I tried to figure out which ones might be thought of as favorites and who the long shots would be. No matter! No Woody Stephens derby entry has ever been more thoroughly groomed than students entering medicine today. Certainly, the families of these new MDs were just as proud as the owners of each Derby entry, regardless of the odds at race time.

Indeed, as I considered the experiences of these individuals during the past four years, the track at Churchill Downs seemed to symbolize the modern-day medical curriculum with each of its four turns representing one year of medical school. Like the basic science years of medical school, the first two turns at Churchill Downs select in favor of raw speed and competitiveness. However, as the field approaches the third and fourth turns, raw speed and competitiveness give

way to stamina and "heart," an inborn trait unique to truly great race horses. Similarly, as medical students approach the clinical years, compulsivity and competitiveness yield to sincerity and clinical reasoning which, like "heart," are largely dependent upon inherent features.

As the field exits turn four and heads for home, the jockeys must turn to the whip in the final test of breeding and preparedness. It is not until this point in the race that the riders learn their mounts' full potential. Likewise, following match day the senior students are forced to reach for inner strength and test their commitment for their chosen careers in the intervening months before graduation and the beginning of residency.

And so went convocation . . .

The next day as the pre-race ceremonies got under way with all their color, my mind wandered back to the day before, when I had compared medical school to the Kentucky Derby. I could not help wondering what pseudonyms medical students might assume when I contemplated such names as "Spend A Buck," "I Am The Game," "Chief's Crown," and "Eternal Prince" in that Derby. Quickly, "Mack The Knife" came to mind, and "Onchoman," "Eye Spy," "Rheumatolstoy" and "Bold Delivery." As race time approached, I imagined how the race would be called with entries like these. I allowed it might go something like this:

From School of Medicine, East Carolina University, Greenville 27858. Illustration by Ernest A. Craig, M.D.

The field is set . . . and they're off! . . . It's Bold Delivery on the inside with Eye Spy, Mack The Knife, and Rheumatolstoy just back with Onchoman bringing up the rear. . . . Into turn one it's Bold Delivery out in front with Eye Spy back by two lengths followed by the rest of the field. . . . Out of one and into turn two Mack The Knife is making a move on the outside, with Bold Delivery still setting the pace. . . . Onto the back stretch Bold Delivery and Mack The Knife are neck and neck with Eye Spy closing fast followed by Rheumatolstoy and Onchoman. . . . Entering turn three it's Eye Spy with the lead by one followed by Mack The Knife, Rheu-

matolstoy, Bold Delivery, and Onchoman. . . . Through three quarters it's Eye Spy, Rheumatolstoy, Mack The Knife, Bold Delivery, and Onchoman. . . .

Rounding turn four Rheumatolstoy's gaining ground on Eye Spy with Onchoman beginning to make his move. . . . Heading for home it's Rheumatolstoy out in front by a half with Onchoman coming hard. . . . Bold Delivery and Mack The Knife are off the pace. . . .

Nearing the wire it's Rheumatolstoy in the lead with Onchoman closing fast . . . but it's Rheumatolstoy at the wire the winner by a nose! ■

A defense against cancer can be cooked up in your kitchen.

There is evidence that diet and cancer are related. Follow these modifications in your daily diet to reduce chances of getting cancer:

1. Eat more high-fiber foods such as fruits and vegetables and whole-grain cereals.
2. Include dark green and deep yellow fruits and vegetables rich in vitamins A and C.
3. Include cabbage, broccoli, brussels sprouts, kohlrabi and cauliflower.
4. Be moderate in consumption of salt-cured, smoked, and nitrite-cured foods.
5. Cut down on total fat intake from animal sources and fats and oils.
6. Avoid obesity
7. Be moderate in consumption of alcoholic beverages.

No one faces cancer alone.

We're Here For You, North Carolina

Medical Mutual Insurance Company was created by North Carolina physicians in 1975 to stabilize the volatile professional liability insurance market. For eleven years, we have been able to keep that market open for all physicians in North Carolina. Because our primary goal is stability—not profit—we will continue to serve you while other companies limit their markets or restrict coverage.

Our presence in North Carolina guarantees that experienced physicians can practice their specialties,

new physicians can begin their practices, and citizens of the state will get the high quality medical care they deserve. By bringing stability to the professional liability market, we're serving the public good.

Medical Mutual. We'll be there when you need us.

Medical Mutual
Medical Insurance Agency, Inc.

Medical Mutual Insurance Company of North Carolina and its subsidiary, Medical Insurance Agency, Inc. are located at 222 North Person Street, Raleigh, NC 27611 919/828-9334 800/662-7917

The Open Door Medical Clinic: A Community Response to the Medically Indigent

Don Lucey, M.D., and Sheila Parker, Ph.D.

Poverty often robs its victims of their health. Poor health guarantees the continuation of poverty for the medically indigent. The poor and the near-poor certainly cannot afford to pay the high costs of health care.

According to the Center for Health Policy Research and Education at Duke University, 1,900,000 North Carolina residents are medically indigent. Of the poor in our state, 42% have no health insurance coverage of any kind. Government programs have not been adequate in meeting the needs of the medically indigent.

Opening the Door

What are the alternatives? This was the question asked by some members of the Wake County Medical Society. It was clear that there were many individuals in Wake County who were not being served by the existing health care system because they had no health insurance, no Medicaid coverage, and no funds to pay for health care. Concern about this situation led to the organization of a planning committee comprised of eight health care professionals from the Raleigh community. The committee planned a free health clinic that would provide medical and dental care to those who could not pay. Knowing that accessibility was an important factor, the committee found a central downtown site for the clinic in the basement of the Raleigh Rescue Mission's Open Door Chapel at \$1 per year rent.

Next, the committee decided to find a private non-profit community-based organization that would be willing to adopt and support the free clinic as an ongoing project. The Urban Ministry was the best possible choice because of its commitment to care for the poor; its growing support from the ecumenical community, individuals, and local governments; and its great sources of volunteers. In 1985 the committee turned over the administrative reins of the Open Door Clinic to the Urban Ministry Center.

The committee now functions as the clinic's advisory council, providing technical assistance. Dr. Don Lucey, who chaired the planning committee, now serves as the clinic's medical director without pay. The committee worked to make the medical and the general communities aware of the free clinic concept, recruited volunteers to staff the clinic, and solicited contributions of money, medications and equipment. The response has continued to be very generous and supportive.

Two years ago the Urban Ministry Center hired Dr. Sheila Parker as the paid clinic director, who is responsible for all administrative aspects of the clinic. Dr. Parker coordinates the activities of the volunteer staff, who now number 30 physicians, 53 nurses, 11 laboratory technicians, 18 pharmacists, 25 dentists, and 27 other volunteers who perform various administrative tasks. These volunteers rotate their service in the clinic once every one or two months.

The Open Door Medical Clinic opened for service October 15, 1985. Social service agencies and churches were informed of the opening and encouraged to refer clients meeting the criteria for free health care. The dental services were added in December 1986. The clinic offers a pleasant and informal setting for both the clients and the volunteers. It is open twice weekly from 5:30 p.m. to 9:30 p.m., Tuesday and Thursday. These clinic hours are important, because it makes the clinic's services available to those who must work during the day. The clinic staff on a given evening consists of two physicians, one dentist, three nurses, one lab technician, one pharmacist, and three administrative workers. On Tuesday evenings, approximately 30 patients receive medical or dental care. Thursday evenings are reserved for women's health care other than prenatal care.

In the interest of providing quality care for the patient, several medical specialists have volunteered to provide free care in their offices for clinic patients needing specialty care. The patient whose health needs cannot be met in the clinic is referred to one of these specialists or to the Outpatient Clinics of the Wake Medical Center.

The clinic's laboratory and pharmacy are stocked by contributions from area physicians, pharmaceutical companies,

From the Open Door Medical Clinic, 711-A North Person St., P.O. Box 11302, Raleigh 27604.

and medical supply companies. When patients are in need of medications that are not available in the clinic's pharmacy, the Urban Ministry Center has special funds for their purchase.

Individuals requesting care at the Open Door Medical Clinic are screened for financial eligibility based on income guidelines and the lack of medical insurance coverage. If the client is eligible, the nursing staff assesses the patient's needs and records the medical history. The patient is then seen by one of the physicians on duty, for diagnosis and treatment. A laboratory technician is available to perform routine tests. A local hospital has agreed to analyze any tests that cannot be performed at the clinic without charge to the clinic or the patient. The physicians and dentists consult with the pharmacists about available medications to meet the client's needs. Patients are then instructed about appropriate care, scheduled for follow-up care, or referred to the appropriate health care professional or facility.

It is important to note that a local county medical organization probably would not be able to operate this type of free clinic because of the need for administrative staff, vol-

unteer resources, and the organizational network that reaches throughout the community. The religious community in any town has the ingredients for this type of effort. The local medical society would make the greatest impact by encouraging its physicians to volunteer their services and by prompting donations of pharmaceutical supplies and equipment. The local medical society might also develop a system for receiving medications and medical supplies from area physicians' offices and delivering these to the clinic.

The Indigent Health Task Force of the North Carolina Medical Society has attempted to review various approaches to improving access to quality health care for all citizens. One of many recommendations is the expansion of Medicaid, the current status of which seriously limits the numbers of poor individuals who are eligible for assistance.

The Open Door Medical Clinic is a compelling illustration of what one community can do to meet the needs of the medically indigent. It demonstrates how various existing groups, concerned individuals, and facilities can work together to provide free medical and dental care. ■

Performance-Based Credentialing

What Does This New Buzzword Really Mean?

Richard E. Thompson, M.D., and David R. Thompson

In general, "credential" means "something that gives title to credit or confidence; testimonials showing that a person is entitled to credit or has a right to exercise official power."

However, to doctors working in hospitals, "credentialing" has taken on a very special meaning:

Hospital credentials = Hospital medical staff membership and/or specific clinical privileges requested by an applicant, recommended through specified medical staff mechanisms, awarded, denied, restricted/reduced, updated/revised and/or revoked by the hospital Board, and renewable every two years.

Regardless of any other "credentials" held by a practitioner, only the hospital's Board determines what a practitioner is allowed to do in that hospital. *Everyone* who does *anything* to patients in or under the auspices of the hospital or medical center *must* have a "ticket" from the *Board*.

This state of affairs has been much misunderstood. There are still physicians who feel that hospital membership and privileges are granted in one of the following ways:

as a result of discussion and vote at a general medical staff meeting — a definite "no-no" in today's antitrust and conspiracy-conscious era;

by award of the Credentials Committee of the medical staff. No. The Credentials Committee recommends to the Medical Executive Committee which recommends to the Board;

by award of the clinical department chairman. No. The clinical department chairman's recommendation to the Credentials Committee as part of preliminary work in processing the application is critical, but clinical departments do not grant membership and privileges.

This is not a new concept. In the statement which really created "the medical staff organization" in 1917 (one-page standard for hospitals of the American College of Surgeons),

From Thompson, Mohr & Associates, Inc., 312 Florida Ave., N. #344, Tarpon Springs, FL 33589. Dr. Thompson spoke at the North Carolina Hospital Association seminar and a number of the persons present requested that the NCMJ publish his paper.

it is established that medical staff rules and regulations must be subject to Board approval.

Therefore, the real question is not "Does the medical staff grant membership and privileges or does the Board?" That question was answered long ago. It is the Board. The real question is "Who is the Board and how is it acting?" One of the major challenges of the next few years is to solve the inherent dilemma of needing true peer recommendations and judgments on credentials qualifications, yet avoiding abuse by true peers who are in competition with the applicant. The solution is simple to describe, but not easy to implement: objective hospital-conscious, patient-conscious, and community-conscious physicians participating in good faith as hospital Board members.

For now, "credentials" may be the "war department" of your hospital/medical staff relationship. This is because hospital credentialing represents a control over and above controls in other settings, such as a physician's office practice. This control is often resented by physicians and is often viewed with suspicion by physicians and others who are subject to hospital "credentialing."

The Patient-Protective Role of "Credentialing"

It must be remembered that "credentialing" was conceived as and continues to be a patient-protective activity, not a means of economic control. One must not deviate from this patient-protective function by making "credentials" decisions about applicants that can even be perceived as "economically contaminated": a true peer in a position of authority, using the credentials mechanism to take advantage of a competitor.

Antitrust and Credentialing

Readers should become thoroughly familiar with the provisions of the Health Care Quality Improvement Act of 1986. In brief (check this interpretation with an attorney):

The Act requires a national data base containing in-

formation about physicians who have lost clinical privileges or state licenses to practice. Once this information base is available, hospitals will be expected to refer to it prior to awarding membership and privileges to physician applicants.

The most immediate provision of the law is some relief from antitrust complaints by an aggrieved denied applicant. Primarily related to credentialing actions based on peer review, the Act can be summarized as requiring good faith effort, action taken in the interests of patient care and based on confirmed information about practice problems, and compulsive attention to "due process."

The Joint Commission's "Agenda for Change"

Another pressure on medical staff functions, including the function of "credentialing," is from the Joint Commission on Accreditation of Hospitals, whose thick accreditation manual is the great-great-great grandchild of the one-page standard for hospitals of the American College of Surgeons. Effective performance-based credentialing is now a major requirement of the Joint Commission on Accreditation of Hospitals medical staff standard.

Public Watchdog Groups

Many newspapers, news magazines and TV news broadcasts have recently examined the public's dissatisfaction with the dependability and quality of services provided by "service industries," including airlines, hotels, hard goods industries such as the automobile industry, and *hospitals and physicians*.

Because of "the order sheet" (the physician "orders" the patient's care), hospital medical staffs will be in the thick of efforts to respond to these public demands for accountability, defined as data-based, objective evidence confirming consistent, effective and careful performance by practitioners in hospitals.

Just Plain Old Patient Care

Pretend your family member is the patient. If you wanted to evaluate and know the current competence (not just the qualifications, as represented in diplomas and certificates) of the physician who just hospitalized your family member, what would you depend on?

At the present time, no credential held by the physician reflects:

- the exact nature of the physician's practice, and
- the physician's current competence

other than the physician's clinical privileges at the hospital, which are assumed to be:

- based, initially, on careful evaluation of qualifications and current competence, and
- reappraised objectively every two years.

The "Credentialing" Process

Hospital "credentialing" has three major parts:

- 1 Initial granting of medical staff membership
- 2 Initial granting of clinical privileges
- 3 Renewal, revision and/or updating of clinical privileges:
 - routinely, every two years
 - by "corrective adjustments," which may be clinical department-level functions, and/or
 - corrective action — Medical Executive Committee and Board function.

Initial Membership

Granting of initial membership on the staff has nothing to do with performance. It is based on general information about training, past experience, current state licensure, Drug Enforcement Agency (DEA) registration, liability insurance coverage, references, an interview, etc.

For a new staff member, assignment to a medical staff category and assignment to a clinical department also have nothing to do with performance. They are based primarily on:

- the individual's clinical specialty
- the individual's anticipated use of this hospital.

Initial Clinical Privileges

This is the first of two applications of "performance-based credentialing."

Once upon a time. Up until twenty years ago, there was no such thing as delineating specific clinical privileges. A physician could pretty much treat whatever came his or her way, no questions asked. Active staff status was something like "tenure." Active staff status somehow implied more clinical privileges than courtesy staff status, even though there was no performance-based logic to that use of "categories."

Delineation of clinical privileges based on board certification. Until recently, clinical privileges were distributed according to board certification. That is, if a practitioner possessed a certain specialty certificate, then he or she was deemed (forever) to be qualified in all aspects of that clinical specialty. Conversely, if an individual did *not* hold a spe-

cialty certificate of a certain kind, then he or she was automatically deemed *unqualified* to treat certain medical conditions and/or perform certain surgical or invasive diagnostic procedures.

Initial credentialing based on performance/training: subdividing the board certified. The new approach — performance-based credentialing — can be best summarized as “pretend you’re the patient” credentialing.

Example 1: You have an orthopaedic certificate, but if you wish to do total hip joint replacement, you must provide additional evidence of training and/or performance in this particular procedure.

Example 2: You are a board certified pediatrician. But if you wish to do intensive newborn care, you must provide additional evidence of training and/or performance in this clinical area.

Example 3: You are board certified in the specialty once known as “ENT,” now named otolaryngology/head and neck surgery. But, if you are recently trained, you may be qualified for the privilege of thyroidectomy and treating laryngeal cancer. But if your training and experience do not include these conditions and procedures, then you *cannot* argue that you should have this privilege just because another doctor with the same specialty certificate does.

Example 4: You are a family physician. You have always been really interested in reading EKGs. You request this

privilege because another family physician in your small hospital has the privilege to read EKGs, so you figure you should have it, too.

Wrong.

The other family physician has had a six-month preceptorship with a cardiologist for the express purpose of being competent in reading EKGs. You have not. You cannot expect to have this clinical privilege just because the hospital (defined in credentialing as medical staff department/Credentials Committee/Medical Executive Committee *plus* Board *plus* hospital executive/management staff) gave that privilege to the other family physician.

Consistency in credentialing does *not* mean “we let this doctor do it, so I guess we have to let that doctor do it.” Consistency in credentialing means that we have a clear rule, and we followed it. The other doctor met it and you did not. that is why that doctor has the privilege and you do not.

For an example of how to establish such a performance-based rule for granting initial clinical privileges, see figure 1.

Renewal of Clinical Privileges: Information-Based Reappointment

The youngest and, so far, least developed area of “credentialing” is “information-based reappointment.” Information-based reappointment now has three parts:

- 1 Updating of general information. Examples: Reconfirmation of state license to practice, DEA registration, continued malpractice liability coverage, meeting requirements for attendance at medical staff meetings (if active staff), etc.
- 2 “Volume of hospital practice.” Simple figures indicating numbers of admissions, numbers of procedures performed, numbers of cases treated, numbers of consultations asked for/provided, etc.
- 3 Performance summary. The volume of hospital practice plus performance summary data together might be referred to by some as a “practice profile.” This can be a simple, one-page summary on clinical performance, based on ongoing review activities (see figures 2 and 3, next page).

Five Keys to Effective Credentialing*

- 1 *Emphasize joint efforts.* The medical staff, board and administration must work together to respond to today’s critical “credentialing” dilemmas.

* See figure 2

Figure 3. Feedback Reappointment

2 *Be objective.* Collect and use as much information as possible.

- 3 *Be consistent.* If it's the rule for one applicant, then it's the rule for all applicants.
- 4 *Separate "membership" from "privileges."* Medical staff appointment/membership and category assignment (active, courtesy, etc.) relate only to placement on the staff and membership prerogatives such as voting and holding office. Delineation of clinical privileges *separately* provides a specific definition of the exact nature of each staff member's hospital practice.
- 5 *Follow written rules.* Medical staff bylaws must be updated, explained, followed and supplemented.

Where Is Credentialing Headed?

Believe it or not, the next big issue in credentialing will probably be credentialing of nurses. Example: Two RNs work in the nursery, but one works in the normal newborn nursery, and the other works in the pediatric intensive care unit. What "credentialing" tests should be demanded of the nurse working in the area requiring more nursing skills?

With respect to physician credentialing, the biggest need is to resolve the dilemma of

- the necessity of true peer judgment of applicants' qualifications, but
- the temptation by true peer competitors to abuse the system by "economically contaminating" their evaluation of an applicant's qualifications.

If that dilemma cannot be resolved, then obviously credentialing is headed *away* from the present "hospital-specific" system. Physicians would then not be licensed by the state to practice "medicine and surgery in all its branches," but by law, physicians would become limited license practitioners! Hopefully, objectivity and consistency in performance-based "credentialing" will prevent such an unfortunate occurrence. ■

About the authors: Richard E. Thompson, M.D., is president of Thompson, Mohr & Associates, Inc. Using the Objective Structured Clinical Examination at the University of North Carolina Medical School

Axalla J. Hoole, M.D., Vicki Kowlowitz, Ph.D., William C. McGaghie, Ph.D., Philip D. Sloane, M.D., and Romulo E. Colindres, M.D.

Much evidence supports the claim that the assessment of medical students' clinical skills is often done poorly or not at all. In 1962, Seegal and Wertheim concluded from conversations with house staff and faculty that "not one of these individuals had ever been overseen by a senior instructor while performing a complete physical examination prior to receiving his medical degree."¹ They stressed the need to supervise student performance during clinical clerkships and reported a modest program at Columbia University in which each clinical clerk was observed performing a complete physical examination during the first three weeks of a clerkship. In 1976, Engel accused the American medical education system of failing to prepare physicians in the fundamental skills of clinical observation and clinical reasoning. After informal inquiries among medical students at more than fifty North American medical schools, Engel found that few students reported having been observed during an interview and physical examination more than one or two times.²

In 1984, the Association of American Medical Colleges emphasized that inadequate supervision of students can evolve on clerkships. It recommended that clearly stated goals and consistent supervision by experienced faculty and residents be provided on each clerkship.³ Professional associations, including the American Board of Internal Medicine (ABIM), also have called for more attention to evaluation in undergraduate and postgraduate medical education.⁴

Unfortunately, current methods of evaluating clinical

skills, both of medical students and of house officers, focus primarily on students' recall of information rather than on instructors' observations of performance. The only direct evaluation of skills in physical diagnosis or ward clerkships usually comes from preceptors who submit an impression derived from piecemeal observations made at the bedside. When classes were small and there were a number of preceptors committed to clinical teaching, these evaluations may have been adequate. Indeed, many preceptors felt they knew the students well. However, larger classes and the proliferation of duties have led to precepting by faculty who have little time for clinical teaching and, ultimately, evaluation. The result has been that courses in physical assessment are often followed by examinations composed of multiple-choice questions. Such tests cannot evaluate clinical abilities or attitudes — only the ability to recall facts.

A number of solutions have been proposed and used to strengthen the evaluation of medical students' clinical skills. They include increased attention to student performance of physical examinations at the bedside; individual, observed complete physical examinations; employing patients as instructors and evaluators;⁵ patient-management-problems (PMPs) to assess clinical reasoning and judgment;⁶ and oral examinations.⁷ However, each of these proposed solutions has limitations due to excessive time required of faculty, uncertain fidelity to the realities of clinical medicine, or an acknowledged lack of reliability and validity. Also, most of these methods do not include an evaluation of the basic techniques of interviewing and physical examination.

From the Departments of Medicine and Family Medicine, University of North Carolina School of Medicine, Chapel Hill 27514. Work on these projects was supported in part by grant #D15-P84003-07 from the U.S. Department of Health and Human Services and from the National Fund for Medical Education.

The UNC Evaluation

The clinical skills evaluation now in use at the University of North Carolina (UNC) School of Medicine is the Objec-

tive Structured Clinical Examination (OSCE), developed by Scottish physician Ronald Harden.⁸ It is used in many commonwealth countries, and typically its chief purpose is evaluation.

The OSCE is similar in design to practical examinations in gross anatomy. Students rotate through a timed series of stations that are focused on physical examination, history taking, and problem solving. At each station students complete a single task, such as description of a set of skin lesions, examination of the ocular fundus, obtaining the history of the present illness, or examination of the abdomen. The skill to be tested is decided in advance and a checklist is prepared which lists the specific components of a well performed examination. Observers at each station evaluate many students doing a single clinical task on the same patient and record results on the standardized checklist. Evaluators may be faculty or trained observers; stations are usually three to five minutes long.

This multiple-stations approach is purported to yield a comprehensive examination of clinical abilities. The larger the number of stations, the greater the validity of the examination. The difficulty of each station can be made ap-

propriate to the level of training of the students being examined.

The OSCEs at the UNC School of Medicine differ from the typical OSCE examination in two ways, which emphasize their orientation toward education rather than evaluation only: faculty and house staff comprise most of the evaluators, with few trained nonphysicians used; and one minute has been added to each station specifically to provide an opportunity for discussion.

At UNC, OSCEs are being given at two academic levels — at the completion of the second-year physical diagnosis course and after each third-year medicine clerkship.

The first OSCE is a final evaluation only for techniques of physical examinations such as breast, heart, or eye examinations. In addition to observing performance, observers may ask students to describe their findings. Clinical stations, representing a majority of the stations, are mixed with didactic stations in which students are asked questions about photographs, slides, and videotapes (table 1). The students are not expected to make diagnoses or to show proficiency in problem solving.

Table 1

OSCE Stations for UNC Second-Year Student Evaluation, 1986

<i>Stations</i>	<i>Skills Assessed</i>	<i>Method of Evaluation</i>
Knee examination	Inspection, description of findings, approach to patient	Faculty observation using checklist (FC)
Ear examination	Recognition of physical findings	Identifying anatomic structures
Heart sounds (Simulated)	Listening, discrimination of heart sounds	Students record findings
Nasal examination	Inspection, approach to patient, use of speculum	FC & student identification of anatomical structures on drawing
Abdominal examination	Inspection, auscultation, palpation, percussion, approach to patient	FC
Gross visual field	Examine patient's visual field	FC
Videotape of gait disturbance	Identify abnormalities, identify neuroanatomic locations	Students record findings
Breast examination: live patient	Inspection, palpation, approach to patient	FC
Examination of thyroid gland	Inspection, palpation, approach to patient	FC
Examination of ocular fundus	Examination technique, use of ophthalmoscope, approach to patient	FC
Breast examination: simulated	Inspection, examination technique, identify nodule	FC Students record findings
Dermatology	Ability to describe lesions	Students record findings
Deep tendon reflexes	Examination technique, approach to patient	FC
Pulmonary examination	Palpation, percussion, auscultation, approach to patient	FC
General appearance	Observe videotape of short interview	Students record findings
Heart examination	Inspection, palpation, auscultation, use of stethoscope	FC
Mental status	History taking, recognition of abnormal mental status	FC, using simulated patient
Interview (2 stations 10 minutes)	Interviewing technique	1) Faculty observes interview 2) Discusses interview

Table 2
OSCE Stations for UNC Third-Year Student Evaluation

<i>Stations*</i>	<i>Skills Assessed</i>	<i>Method of Evaluation</i>
Hepatosplenomegaly	Auscultation, palpation, percussion, differential diagnosis	Faculty observation using checklist (FC) short answer essay questions
Urinary tract infection	History taking, approach to patient, differential diagnosis	FC, short answer essay questions
Joint pain: arthritis	Inspection of hands, palpation, differential diagnosis	FC, short answer essay questions
Peripheral neuropathy	Inspection of feet and lower legs, palpation for pulses, neurological exam	FC, short answer essay questions
Thyroid nodule	Inspection of neck, palpation, auscultation	FC, short answer essay questions
Cough and fever	History taking, interpretation of laboratory data, approach to patient, differential diagnosis	FC, short answer essay questions
COPD	Inspection, palpation, percussion, auscultation	FC, short answer essay questions
Aortic valve	Inspection, auscultation, approach to patient, differential diagnosis	FC, short answer essay questions
Chest pain	Interview technique, approach to patient, differential diagnosis	FC, short answer essay questions
Smoking cessation	Patient counseling about ways to stop smoking	FC

*Each topic has two stations, one for patient evaluation and one for questions about the patient.

The second OSCE, administered after completion of each third-year clerkship, is more advanced than the second-year test and requires diagnostic maneuvers and clinical decisions. Stations are presented in pairs with each pair directed toward a real clinical problem. At the first station, students either examine a patient or take a history. At the second station they are asked to answer written questions about the case, discuss the problem with the observer or comment on additional x-ray or laboratory data that are provided for discussion (table 2).

The second-year examination, composed of 20 five-minute stations, lasts about two hours. In order to test 160 students in one day, we run two examinations simultaneously and start a new set of examinations every two hours at 8:30, 10:30, 1:30, and 3:30. Because weekends are the only time that space is available, we have to conduct this examination on Saturday. Preceptors usually participate for two examinations; patients, who are usually first- or third-year medical students or nursing students, are paid by the hour and work for one to four examinations. To increase the educational benefit from being a paid patient, students are assigned to a different station for each test. Patients who have sensitive areas examined can tolerate only one two-hour shift before moving to another station. The third-year examination, because it only involves forty students, can be done during the week and is a less herculean task. Because one of the goals of this examination is the identification of physical findings, these patients must be recruited from our outpatients.

The second-year OSCE was developed at UNC and ad-

ministered to part of the class in 1985 and to the entire class of 160 students in 1986. In contrast, the third-year clerkship OSCE, a one-year trial, is a product of a collaborative student evaluation project involving three other medical schools: University of Texas Medical Branch at Galveston, Southern Illinois University, and the University of Washington, Seattle. Financed by the National Fund for Medical Education, this project aims to see if an identical clinical skills examination can be successfully administered at four geographically and functionally different medical schools.

Results

Response to a student questionnaire distributed after each examination indicated that the exercise was received enthusiastically by the students. The following assessment of the second-year OSCE is based upon the 122 returned questionnaires, representing 90% of those distributed (table 3, next page). Ninety-one percent of the students rated the OSCE as a valuable experience; 92% of the students considered the feedback they received at the stations valuable; and 86% thought that the OSCE was a worthwhile method for assessing clinical performance. Without exception, the students recommended that the OSCE be run again next year.

A similar questionnaire was distributed to the third-year medical students. The results are based on 92% of the 77 questionnaires distributed for two clerkship rotations (table 4, next page). One hundred percent of the students felt that

Table 3**Results From a Student Questionnaire on the Second-Year OSCE, 1986**

	<i>Not Valuable</i>	<i>Somewhat Valuable</i>	<i>Valuable</i>	<i>Very Valuable</i>
1 Educational value:	0%	2%	25%	66%
2 Value of feedback:	0%	7%	26%	66%
3 Method of clinical evaluation:	0%	14%	39%	47%
4 Should the OSCE be administered again?	NO — 0% YES — 100%			

Table 4**Results From the Student Questionnaire on the Third-Year OSCE, 1986**

	<i>Strongly Disagree</i>	<i>Disagree</i>	<i>Agree</i>	<i>Strongly Agree</i>
1 I feel this OSCE was a valuable learning experience:	0%	0%	31%	69%
2 Overall, the feedback I received was valuable:	0%	0%	31%	69%
3 I feel the OSCE is a worthwhile method for assessing clinical competence:	3%	8%	56%	32%
4 I recommend the OSCE be run again next year in the medicine clerkship:	1%	3%	31%	65%

the OSCE was a valuable learning experience and that the feedback received at the stations was valuable; 88% of the students thought the OSCE a worthwhile method for assessing clinical competence; and 96% recommended that the OSCE be run again next year in the medicine clerkship.

At exit interviews, students reported that the OSCE provided the longest discussions of physical findings and clinical technique they had ever had with attending physicians. Faculty reported an increased awareness of students' clinical abilities and expressed enthusiasm for the opportunity to observe and teach techniques of the physical examination. Most participating faculty acknowledged the need for more supervisory contact with medical students.

Discussion

Many of the complaints made about other examinations of clinical skills are answered by the OSCE. Although there is no substitute for bedside observation, the OSCE provides some of the realities of clinical medicine and also obtains a higher degree of standardization by having all students examine the same patient while being observed by the same scorer using preset standards. In this way, especially when two scorers are periodically used, observer bias and variability are decreased and reliability is increased. Also, the test may be made less labor-intensive without losing its orientation toward clinical skills by using students as "patients," especially when specific physical findings are not necessary or the "patient" can be trained, and by using videotapes, photographs, slides, or x-rays, about which questions may be asked.

Our experience unfortunately has shown that despite at-

tempts at standardization, evaluators vary greatly. Videotapes of the examination showed that some evaluators began to prompt as soon as the students had the slightest hesitation, and others waited silently or even ominously until the students had absolutely finished. Also, evaluators do not use the checklist in a consistent manner.

Moreover, there is no universal technique for physical examination. In fact, in the physical diagnosis course we stress that good physicians may differ in the way they approach a simple screening examination. For this test we are trying to reach consensus on a standard technique and have all observers, faculty and residents, review and agree upon the content of the checklist used in grading.

The experience of implementing the OSCE at UNC has been unequivocally positive. What started as a tool for evaluation is emerging as a means of education. Its role as an educational endeavor is more than we ever envisioned. This is evident from our most frequently encountered administrative problem: faculty are reluctant to allow students to leave their station until they "get it right!" Also, students routinely volunteer that interaction with faculty is the most valuable feature of the OSCE.

As long as some time at each station is spent discussing performance, there may be a conflict between evaluation and teaching. While this approach strays from the original intent of the examination to be solely evaluative,⁸ we are reluctant to abandon it until we can determine if the evaluative function has been undermined.

Results of the OSCEs have also begun to affect the Medical School curriculum. Lecturers in the physical diagnosis course have adjusted presentations and demonstrations to correct systematic deficiencies and in several cases have

developed additional small group practices. In addition, Medical School curriculum committees are now working on a plan that would assign each of the five basic clerkships responsibility for certifying that students have acquired certain basic clinical skills.

The OSCE also underscores the point that an institution's evaluative practices are its most direct expression of educational intent. Examinations send a message to students and faculty about the information and skills learners are expected to acquire.⁹ Failure to use a deliberate approach such as the OSCE often results in a subjective, ritualistic approach to evaluation administered by faculty who are detached or remote.¹⁰ Students may try to bluff their way through rotations under a verbal "cloak of competence" rather than acquiring and demonstrating key clinical skills.¹¹ Changing the method of student evaluation is one of the best ways to affect teaching practices, and in the end the side effects of the OSCE may be much more important than its original evaluative intent.

Producing an OSCE, a very labor-intensive examination, requires commitment from a large number of faculty. Several people spend many hours a week for months organizing the approximately 50 preceptors, 40 patients, and eight clerical staff necessary on the day of the examination. Our efforts have gone well because we have an interested faculty who each year have requested that the test be repeated. Our intent is to make the test a reliable evaluative/teaching tool that can be given annually without exhausting the good will of the faculty. ■

THE MEDICAL SECRETARY'S OFFICE SYSTEM

Finally — First time ever, forms processing software perfectly customized for medical offices' applications. Cut forms processing time in half!!!!!!

We are offering to let you use a **PROTYPE FREE** for one week. If you think it's impossible for a typewriter to cut a medical secretary's typing time in half, we understand.

That's why we're offering to let you prove it for yourself.

DESIGNED FOR THE MEDICAL OFFICE, the PROTYPE is your typewriter. It's your word processor, it is compatible with your personal computer. The PROTYPE is truly unique.

ZIPS THROUGH FORMS. Our machine is the greatest medical forms processing machine ever invented. Even new forms, with many carbons can be put into the the PROTYPE and processed quickly and accurately. No need to erase!

The DATAPRO REPORT: "It's almost perfect."

NEWSWEEK: "Its ease of operation may be its greatest advantage."

POWER OF A WORD PROCESSOR: You can change it, delete it, fix it, rearrange it — and if you really mess up — our magic "UNDO" key will wonderfully put everything back just like it was before.

It's a special typewriter and word processor and forms processing system and companion to a personal computer—who ever heard of a typewriter that shares PC files—what is done on a personal computer can be transferred to the PROTYPE—and vice versa.

CALL TODAY AND ASK FOR YOUR FREE TRIAL. Oh, yes it does have a 62,000 word spelling dictionary, line drawing, linear graphics included.

Living Ghosts from Our Past

The 1987 Spicer-Breckenridge Lecture

Paul W. Brand, M.D.

The Spicer-Breckenridge Lecture is given annually in memory of two members of the medical school class of 1939 who lost their lives in World War II, Emmet Spicer (1916-1945) and Arnold Breckenridge (1915-1945). The lecture is given during the annual Alumni Meeting of the School of Medicine of the University of North Carolina at Chapel Hill, the only occasion during the year on which students, faculty, and alumni gather.

I am grateful for the honor you do me, that you have chosen me to be the one to remind all of you at Chapel Hill of your own history, and to point you forward along paths that have been illuminated by the lives and by the sacrifice of these two men who have helped to make our own future more secure and more free as well as to have more meaning.

I want to refer to special features of the heritage that Emmet Spicer and Arnold Breckenridge individually have left to all of us, but first we need to remind ourselves that, to a remarkable extent, we are each a composite of men and women of the past. If we take the trouble to study our own patterns of thought and action, we shall come to recognize that we have gotten more from our parents than the sequences of DNA in our genetic inheritance. We have gotten more from our teachers than the facts they have taught. Even our friends and peers, who never set out to teach us anything, may be living on in our attitudes and opinions long after they have left us, separated by distance or death.

I have recently been trying to trace the source of my own disciplines in operative surgery. I do not mean the type of operations that I use, or the reason for using one muscle to transfer, rather than another, for a partially paralyzed hand. I refer to the basic disciplines that I do not think about any

more, because they have become part of my reflex responses to all that happens in any operation. I looked at the methods I use to arrest haemorrhage during surgery. Here I am a little slow. I simply cannot bring myself to grab quickly at a bleeding point with a haemostat, knowing that in my haste I shall probably clamp and crush more living tissue than I need, leaving dead cells to be hauled away by macrophages before the wound can be fully healed and return to the peace of homeostasis. After a careful exercise of memory I have tracked this back to the second of my teachers during my surgical residency, Dr. Thomas Higgins. I used to be fascinated by his ability to pick up the cut end of a tiny blood vessel without any other tissue, and I was very much aware of his critical eye when I was operating, and his occasional snort when I was more than usually clumsy. That was forty years ago, and he is probably no longer alive, but I tell you that he still looks over my shoulder, and sometimes he snorts at me today, though not as often as he used to, because I have become pretty good now as a result of his continuing influence.

Then there is my habit of using the broad soft pad of my thumb to arrest sudden severe bleeding while I wait to plan the next move. That comes from Sir Launcelot Barrington-Ward, who taught me at the Childrens' Hospital in London. I still see him across the operating table, completely at peace while his great thumb rested on a tear of the Vena Cava, and he winked at me and asked "Do we clamp it or shall we sew it up?" Sir Launcelot was surgeon to the King of

Senior consultant of the Hansen's Disease Center, United States Public Health Service, and Clinical Professor of Orthopaedics and Surgery, Louisiana State University

England, and famous in every way, but he never tired of repeating his simple philosophy to every young trainee. "You make mistakes when you panic," he would say "and fast bleeding breeds panic, so don't rush in with instruments. Use your thumb until you know what you want to do, then do it deliberately." He still lives in my own surgical philosophy and technique, and his Ghost still winks at me sometimes when I use my thumb, and his comforting presence still brings a sense of peace where there might have been stress. Part of him will go on living in those whom I have taught, but to them his image may now have blended into mine.

More than half the scientific facts that I learned as a student, and ninety percent of the drugs whose dosage and actions I memorized, have been discarded and lie in the trash cans of history. The treasures that have survived, together with the ghosts of those who taught me, are the disciplines and attitudes by which I still guide my life. I had such a good teacher of the History of Medicine that pioneers like Semmelweis have come back to life. He it was who first identified the role of the surgeon's hands in the spread of infection from patient to patient. It was he who insisted that all the staff should scrub with soap and water. He was thrown out of his hospital appointment by the surgeons who felt insulted by his implied suggestion that they were dirty. Without a job, and laughed at by his peers, he tried to convince the public by printing statements about infection, and handing sheets of paper out to passers-by on the streets. They too laughed at him until his mind became unhinged and he died an alcoholic and pauper. Joseph Lister read his work and went on to fame and fortune by demonstrating the truth of what Semmelweis had proved. When I am tempted to hurry through a perfunctory scrub so that I can get on to operate, it is Semmelweis who stands behind me and says "It cost me my job and my life to establish the truth behind this discipline." So I go on scrubbing until I have completed ten full minutes.

I live beside the Mississippi River and sometimes walk on the levee in the evening. I often swat a mosquito that has had the temerity to settle on my arm for a meal. When I do, I sometimes think to turn to another Ghost beside me and say "Thank you James." This is because there are many gravestones in this district inscribed to the memory of young men and women who died of Yellow Fever. They too had been bitten by mosquitoes. A walk beside the Mississippi was a perilous enterprise in those days. But Dr. James Carroll, a young army surgeon, volunteered to be part of an experiment to test the theory that Yellow Fever was transmitted by the *Aedes aegypti* mosquito. He moved to an area where there was no Yellow Fever, while others captured mosquitoes which had fed on victims of the disease. James Carroll watched as a wide mouth jar was inverted over his arm, and the mosquitoes drove their proboscises into him. There were other volunteers, and they got Yellow Fever too, but it was Dr. James Carroll who died of the infection. His sacrifice opened up new knowledge and started the

process which now makes it safe for me to stroll beside the Mississippi in the dusk. Thank you James.

During surgical ward rounds in India I once caught a strange expression on the face of one of my young trainees in surgery. He was examining the abdomen of a patient while continuing to ask her some questions. These were probing a rather embarrassing area relating to the possibility that her pain might have origin in a venereal infection. He had screwed his face into an asymmetrical combination of a sympathetic smile and an expression of serious concern. This involved raising one eyebrow while lowering the other, while his head was tilted sideways and thrust forward a little. The thing that caught my attention was that he had the exact expression that my old teacher, Professor Pilcher, used to use on just such occasions. I could not avoid commenting on this extraordinary coincidence by which this young Indian surgeon had imitated the facial expression of an Englishman he had never seen. Then another young surgeon at the bedside laughingly told me, "But sir, his face is exactly your face!" I was taken aback and began to ask myself what I was teaching these trainees. Was it surgery or was it new ways to smile?

After more reflection I became rather pleased. Professor Pilcher had been rather reserved and shy in his manner, but he took enormous care to make sure that his patients understood his basic commitment to them, and sympathy with them. He avoided saying anything that might be misunderstood and increase their fear or break down their trust. He would never allow any of us to laugh at the bedside at any little hidden joke we might have amongst ourselves, because the patient might think that we were laughing at him. The rather contorted smile that I had observed on the face of my trainee was really Dr. Pilcher's expression of love and concern mingled with a necessary professional restraint. I began observing some other faces and mannerisms at the bedside. Seeing a similar sort of attitude and half smile in more than one of my students, I noted that it occurred when they were anxious to win the trust and affection of their patients. There was no attempt at conscious control of their facial muscles, but it must have been an attempt to do as they had seen me do, even as I must have cultivated, without conscious volition, the attitudes of my teacher.

So Professor Pilcher was living on in India, where he had never been in the flesh. Even today his smile, on other peoples' faces, is perhaps breaking down barriers between patients and doctors in hospitals from Madras to New Delhi. If that is true I am thankful that I can not only continue to benefit by what my mentors have taught me, but can pass on to others the living attitudes and imperatives that have made them great. I can share my living ghosts and blend their spirits with my own so that the quality of all our lives may be enhanced. It is important that we choose our models from amongst the greatest and finest that we know, for they will live with us longer than we may think.

Amongst the ghosts that remain with me is that of a patient in India. He was one of our early leprosy patients, in the

days when I was just beginning to operate to correct their deformed hands. I was away from home for a few days, and the young man came to my house, asking for me. His hands were bandaged, and his feet wrapped in rags through which the wetness of discharge from his ulcers was very apparent. My wife Margaret told him to come back when I returned, and to see me in the hospital clinic. His face looked so sad as he turned away in despair that Margaret felt impelled to ask him if he had somewhere to stay. He shook his head, saying he would manage somehow. She knew no hotel would accept him, and it was obvious he had no money. He had walked far on his wounded feet to come to us. With a sure impulse Margaret said, "You are welcome to stay with us, if you like. We can make up a bed on this veranda, and you can share our food until my husband comes home." He soon had clean dressings on his feet, and the children were told to be nice to him, but not to come near enough to catch his infection. In those days we knew only a little about the disease.

When I came home, the patient, Sadagopan, stood up with downcast eyes while my wife welcomed me. She answered my unspoken question with the words, "You see, he had nowhere to go." I said, "but . . . the children . . ." Yes, she had taken what care she could; but we had told people, had we not, that leprosy was not highly infectious? Besides, *he had nowhere to go . . .*

That scene has lived with me ever since. It was, in part at least, the stimulus for my collecting money to build a village of mud-and-thatch houses where leprosy patients could live during the time we were finding ways to rehabilitate them. The sad face of that young man, with latent dignity and intelligence, but frustrated by deformity, poverty and stigma has become for me the face of all such displaced persons. The haunting words "he has nowhere to go," and the sweet face of my dear wife to whom it was so clear that this was a personal challenge to us and to our home, have lived and spoken to me all down the years. I do not want that ghost ever to die or fade away. It would be too easy to retreat behind a trite statement, "the government should do something for this kind of case." Who is my neighbor, whom I should love as myself? Sadagopan's story also has a happy ending. On my last visit to India he invited me to his daughter's wedding. He is independent, and has a lovely family. His is a home to which he is proud to invite me. He has somewhere to go.

We may not have much choice over who our parents are, or over who teaches us our medicine. It is not our fault that the news coverage reminds us every day of leaders in the world of finance, of government and even of religion, who have been seduced by greed for money, sex or power. We may be surrounded during our Residency training program by many who are planning their future with a single eye towards financial success. We *do* have a choice, however,

and we do have control over the decision of whom we *choose* to accept as our own personal guides and inspiration. I like to review my own ghosts from time to time in case some have sneaked into the group who should not be there, and who need to be exorcised. I appreciate my Accountant, and have just finished working with him over my income tax returns. However, I do not want any financial advisor looking over my shoulder or whispering to me while I am seeing patients and giving them my advice.

I have been reading with care and appreciation the accounts of the lives of Dr. Spicer and Dr. Breckenridge whom we remember today. When a person is suddenly snatched away from life at the very peak of his idealism and personhood, he sometimes leaves a more vivid impression than is left by those who, like old soldiers, simply fade away. They gave their lives in a cause that united the whole country, and we all share in the freedoms they helped to preserve. Those who were touched by their lives have recorded some of the factors that have made them memorable, and that have made them live on through their influence on others.

**"It is important that we
choose our models from
amongst the greatest and
finest . . . for they will live
with us longer than we
may think."**

Nelson Hairston, Professor of Biology and Ecology here at Chapel Hill, says that by introducing him to the fascination of the study of birds, Arnold Breckenridge had a profound influence on his life and on his career as an Ecologist. I was very happy to

read that statement, because I myself started my interest in Ecology with a love for birds. I am no Ornithologist, but I have developed a deep sense of kinship with all of life on our planet, and I think it was birds that started it. Even as coalminers in England took caged canaries down into the mines with them to serve as warnings, because birds die of methane poisoning before humans do, so we humans in the USA need to watch what is happening to the birds of our country as a result of pollution. We shall be affected next. I myself would like to be remembered for having introduced others to a love of the earth and of all of its living things. On my way to this Medical Center today an old friend of Arnold's, Dr. Erle Peacock, took me to see Arnold's grave and the granite gravestone, on which were inscribed the simple words, "A Lover of Nature." So I applaud with gratitude the influence that Arnold has had, and continues to have through others in this respect.

I do not know if you North Carolinians realize it, but your state has led the way in a most important field. You may think that you will be remembered for basketball. No, the unique thing about North Carolina is that a large number of your church and civic leaders have gotten together to form "The Land Stewardship Council of North Carolina." The initiative came from people, not government, and was spearheaded by the churches. People had realized how the soil of North Carolina was being washed away where there had been irresponsible deforestation and high pressure farming, and they determined to do something about it while

there was still time to save the land and trees for their children and grandchildren. Their influence has been tremendous, and their publications have set a model for all other states to copy. Who knows but Arnold Breckenridge's Ghost may have been working through his influence on some who grew up with him to bring about this awakening. Thank you Arnold for your love of all living things which still inspires people today.

Dr. John Graham, your Professor of Pathology at Chapel Hill, records of Emmet Spicer that he first knew Emmet through the Sunday School which both faithfully attended. Mr. Pope, a close buddy of his in the army, notes that Emmet gave him a little book by Henry Drummond called "The Greatest Thing in the World." Now, I happen to have read that book myself, and more than once, probably at about the same time, for I was about his age and the book was new then. It is the documentation of a sermon that was preached by Henry Drummond based on the Love of God and on that well-known chapter in the New Testament, 1st Corinthians 13, that describes the real meaning of *love*. All of this tells me something important about Emmet. A young officer in the army overseas does not carry books about great sermons with him into combat unless they mean something to him. Colonel Henry Townsend tells of Emmet's final single-handed foray into a valley in Corregidor that was controlled by the Japanese, but in which he knew there were many wounded American soldiers. Emmet lost his life

bringing relief to the wounded men for whom he felt himself to be responsible. Colonel Townsend comments, "They say that there is no greater love than a man lay down his life for his fellow man. That was reenacted that day in that ravine in Corregidor Island."

For that example, and for that Spirit, we are grateful. We need it today in a culture where too many of us are led to think that the greatest thing in the world is money. Even in our own profession we easily fall to the seduction of wealth and power. We forget that we are called to serve our fellow man, and we forget the example of Jesus Christ, the Great Physician who said, "By gaining his life, a man will lose it; by losing his life for my sake, he will gain it." He lived up to his own words, even to the cross, and he knew joy as he saw the effect of his life on others. We need ghosts that will come back to us and remind us that we are servants and that it is in the giving of ourselves that we find our greatest happiness and fulfillment. Emmet Spicer, you knew then and I believe you know now, that the Greatest thing is *love*. Thank you for living it and for dying for it, and for telling us today that love and service to God and to our fellow men and women is worth living for and worth dying for.

Arnold and Emmet, you have inspired us today. May we hold to the best that you have taught us, and pass it on by the example of our own lives, to those who are still to come.

DO YOU SOMETIMES FEEL THAT YOUR PRACTICE IS RUNNING YOU? DO YOU FEEL INTIMIDATED BY THIRD PARTIES? ARE YOU CONCERNED ABOUT YOUR LEVEL OF PROFIT? ARE YOU LOOKING FOR WAYS TO BOOST PRODUCTIVITY?

You, as a physician, need not be told that the practice of medicine is undergoing some marked changes due to many factors, not the least of which are increasing competition and the encroachment of government and other third parties into the delivery of health care. In addition to the above concerns, consider these also:

- Are your expenses too far out of line with your gross (over 55-60%)?
- Do costs appear to be out of control, and you can't figure out why?
- Do you have a low (below 93-95%) collection rate, and do you have trouble making firm financial arrangements with your patients?
- Is your practice unstable or showing difficulty in getting patients to return?
- Are you losing out to the competition in your community?

If you are having difficulty crystallizing your practice goals, or lack the technical expertise to solve any of the above problems, you need the objective, informed viewpoint of a practice management consultant. There is one company with 27 years of continuous service to physicians in North Carolina that provides a total scope of practice management including **free** consultation and **guaranteed, pay-later** practice analysis.

Call us collect for additional information . . . (919) 454-5132.

TUCKER ENTERPRISES, INC. — complete practice analysis.
KEYSTONE MANAGEMENT SERVICES, INC. — total continuing practice management.
CPT COMPANY, INC. — procedural and diagnostic coding studies

Motrin[®] 800 TABLETS mg

ibuprofen

Extreme Pain
Convenience
Economy

Upjohn

A Century
of Caring
1886-1986

Consider the causative organisms...

Ceclor[®]
cefactor

250-mg Pulvules[®] t.i.d.
offers effectiveness against
the major causes of bacterial bronchitis

Haemophilus influenzae, Streptococcus pneumoniae
(ampicillin-susceptible and ampicillin-resistant)

Note: Ceclor is contraindicated in patients with known allergy to the cephalosporins and should be given cautiously to penicillin-allergic patients.

Penicillin is the usual drug of choice in the treatment and prevention of streptococcal infections, including the prophylaxis of rheumatic fever. See prescribing information.

Ceclor[®] (cefactor)

Summary. Consult the package literature for prescribing information.

Indications: Lower respiratory infections, including pneumonia, caused by susceptible strains of *Streptococcus pneumoniae*, *Haemophilus influenzae*, and *Streptococcus pyogenes* (group A β -hemolytic streptococci).

Contraindication:
Known allergy to cephalosporins.

Warnings:

CECLOR SHOULD BE ADMINISTERED CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. PENICILLINS AND CEPHALOSPORINS SHOW PARTIAL CROSS-ALLERGENICITY. POSSIBLE REACTIONS INCLUDE ANAPHYLAXIS.

Administer cautiously to allergic patients. Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics. It must be considered in differential diagnosis of antibiotic-associated diarrhea. Colon flora is altered by broad-spectrum antibiotic treatment, possibly resulting in antibiotic-associated colitis.

Precautions:

- Discontinue Ceclor in the event of allergic reactions to it.
- Prolonged use may result in overgrowth of nonsusceptible organisms.
- Positive direct Coombs' tests have been reported during treatment with cephalosporins.
- Ceclor should be administered with caution in the presence of markedly impaired renal function. Although dosage adjustments in moderate to severe renal impairment are usually not required, careful clinical observation and laboratory studies should be made.
- Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.
- Safety and effectiveness have not been determined in pregnancy, lactation, and infants less than one month old. Ceclor penetrates mother's milk. Exercise caution in prescribing for these patients.

Adverse Reactions: (percentage of patients)

Therapy-related adverse reactions are uncommon. Those reported include:

- Gastrointestinal (mostly diarrhea): 2.5%.
- Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment.
- Hypersensitivity reactions (including morbilliform eruptions, pruritus, urticaria, and serum-sickness-like reactions that have included erythema multiforme [rarely, Stevens-Johnson syndrome] or the above skin manifestations accompanied by arthritis/arthritis and, frequently, fever): 1.5%; usually subside within a few days after cessation of therapy. Serum-sickness-like reactions have been reported more frequently in children than in adults and have usually occurred during or following a second course of therapy with Ceclor. No serious sequelae have been reported. Antihistamines and corticosteroids appear to enhance resolution of the syndrome.
- Cases of anaphylaxis have been reported, half of which have occurred in patients with a history of penicillin allergy.
- As with some penicillins and some other cephalosporins, transient hepatitis and cholestatic jaundice have been reported rarely.
- Rarely, reversible hyperactivity, nervousness,

insomnia, confusion, hypertonia, dizziness, and somnolence have been reported.

- Other: eosinophilia, 2%; genital pruritus or vaginitis, less than 1%; and, rarely, thrombocytopenia.

Abnormalities in laboratory results of uncertain etiology

- Slight elevations in hepatic enzymes.
- Transient fluctuations in leukocyte count (especially in infants and children).
- Abnormal urinalysis; elevations in BUN or serum creatinine.
- Positive direct Coombs' test.
- False-positive tests for urinary glucose with Benedict's or Fehling's solution and Clinitest[®] tablets but not with Tes-Tape[®] (glucose enzymatic test strip, Lilly).

Address of the President-Elect to the North Carolina Medical Society

Henry J. Carr, Jr., M.D.

First of all, I want to express my gratitude for the honor you have bestowed upon me by electing me as your President for the coming year. I am grateful for the confidence you have expressed in me in doing this and I will do my dead level best to justify that trust.

I approach this year with genuine humility and certainly with a great deal of apprehension, and right up front let me say that I sincerely solicit your support, your guidance, your suggestions, your encouragement, and yes, your prayers, as you and I face the many problems and opportunities of medicine currently in North Carolina. My predecessors over the past several years have set a fast pace and high standards as they have accomplished their tasks, and I pledge my best efforts to continue their programs and to deal with any new problems on issues that may arise. I hope with the same dispatch and level of excellence that they have shown.

Over 20 years ago I became actively involved in the North Carolina Medical Society mainly by the influence of two former Presidents of the Society. My former family physician in Roseboro whom I idolized and greatly respected, Dr. J. Street Brewer, encouraged me to "get involved" and had me appointed a member of the Constitution and Bylaws Committee. Dr. Roscoe McMillan of Red Springs was chairman of the committee at that time and he stimulated my further participation in Medical Society activities. As I reflect on my beginning, I feel that I had two excellent supporters who were also sterling examples of caring, dedicated, and loyal family physicians.

As I have observed the undertakings of the Medical Society through the years, the pace of activities has certainly quickened. Many times the House of Medicine has found itself at odds with other segments of society, i.e., government, third-party payors, business and industry and other health care providers, that would have undermined the prerogatives and responsibilities that physicians have to determine what, when, where, in what setting, and at what cost their patients will receive medical care. However, we must as physicians always keep the best interest of our patients

as the number one and unyielding priority, no matter what the circumstance. We must always remember that in the health care system, the most important person or entity is the patient. We mustn't forget that, without the patient, we as physicians would have no purpose in life.

One of my goals in the coming year will be to continue to use the Society's most precious and tremendous resource, its members, to address health care issues in a manner that *builds* bridges among all segments of the North Carolina Medical Society, and between the Society and its allies, and even between the Society and those who are not now its allies. We need to improve relations among the various societies and academies within the North Carolina Medical Society. We have numerous problems that have already been identified that are common to all of us, including but certainly not limited to indigent care, physician diagnosis related groups, relations with professional review organizations, AIDS and sexually transmitted diseases, civil justice reform, and impaired physicians. We need to consolidate our efforts and work together to solve these problems. We certainly can be more effective in solving them, and that would in turn benefit the citizens of our state, if we pull together rather than working separately.

Another area that requires considerable attention is membership. Membership is the life's blood of any organization, both the recruitment of new members as well as the retention of present members. We have had a steady growth in North Carolina Medical Society membership for many years. In fact we have had 14 consecutive years of dynamic growth in AMA membership and North Carolina is the leader in the AMA in this category.

However, this year we have had some defections from our ranks, or put in another way, a failure to renew their commitment and membership by some members who are dissatisfied with happenings outside the jurisdiction and control of the North Carolina Medical Society, as well as other activities of the Medical Society, unanimously approved by the House of Delegates, i.e., the extra dues increase for the civil justice reform campaign. We could liken this problem to a cancer of the cecum with a slow blood loss and the gradual development of an anemia. What we need is a transfusion for our "membership anemia" to get

From President of the North Carolina Medical Society. Dr. Carr presented this address to the Society at its 133rd Annual Meeting, April 1987.

our Society, i.e., the patient, back in shape, so that we can proceed with definitive Rx (surgery) to cure the problem. We need a significant growth in new membership as soon as possible as well as reinstatement of those who have strayed to be able to carry out our objectives. We need that membership transfusion, not oral iron therapy, so we can get on with our goals now.

The Medical Society is taking steps to correct the problems that have caused the discontent among some members and we earnestly solicit their reinstatement and support. We certainly need their help and we feel that they need us. We know that this will be a mutually beneficial move for all of us. There is a large reservoir of non-member physicians in the state that we need desperately to tap. We have plans for a phonathon later in May [1987] to boost our rolls from this group.

The North Carolina Medical Society has many policies, programs, and activities that are clearly beneficial to our members and we must use these benefits to attract new members. Americans have an affinity to unite and form associations to solve problems as well as to protect their interests. Organized medicine, whether it be on the national level, state level, or local county or city level, is the best method to preserve and nurture our freedom to serve our patients as we believe we ought to (in their best interest) as well as to protect our own interests. We must portray this picture to those who are not, but should be, members of our Society.

I have no earth-shattering programs or new deals or fair deals, etc., that we plan to put forward. I think we have enough problems and incomplete programs upon which we need to concentrate and try to solve and conclude. We have lots of wheels that are squeaking and need greasing, and one of my objectives will be to lubricate the squeaking wheels of the North Carolina Medical Society. A few examples of the programs begun by my predecessors that merit our continued attention are:

1. The task force on sexually transmitted diseases and AIDS — this task force is hard at work on this mushrooming local and national health menace or "new plague" that demands immediate attention. This is clearly one of the most profound social and health dilemmas of this generation. One sound approach they have is educating the public about the disease as well as educating our health care professionals, especially the physicians and nurses in the state, as to the management and care, including the treatment, of AIDS victims. Another important aspect of AIDS currently is "what to do about testing." The task force is currently addressing that problem.

2. The task force on indigent care is making strides on how to address the care of the indigent and medically indigent in the state. This is a service that the Medical Society owes to the citizens of North Carolina. As was brought out in the reference committee Thursday, this is a problem of enormous magnitude.

3. Reforming the civil justice system is a difficult experience and a complicated problem that will require a long-term commitment to achieve success. We are working on the foundation of this campaign and are on schedule at this time.

4. The Task Force on Society Governance has worked diligently over the past year to bring you the material upon which you will debate and act later today. A most conscientious effort has brought forth these suggestions.

5. Carolina Doctors Care, the statewide alternative delivery system open to all our members, was chartered in June 1986 following a mandate of the 1986 House of Delegates in Asheville. A stock subscription was initiated and completed, with moderate success. Minimally adequate capitalization has been raised and a final feasibility study is in progress to determine whether or not there is sound data or indication that would warrant proceeding with the company. We have every expectation that Carolina Doctors Care will be well received in the marketplace; however, with the changing climate in alternative delivery systems and the indications that some other forms of health maintenance organizations different from Carolina Doctors Care have not been as well supported as had been expected, and others have met with hard times, final judgment will be reserved until the feasibility study has been completed. Carolina Doctors Care and the North Carolina Medical Society express gratitude to those member physicians who have supported this effort with their purchase of stock. Frankly, we were somewhat disappointed that the support was not greater from our members in purchasing stock; however, we hope that there will be an overwhelming participation response from the remainder of the membership across the state when the company becomes operational. This effort represents another step by the North Carolina Medical Society to assure that physicians maintain a voice which can be heard in the health care marketplace. To succeed we will need the help of all of you.

6. The Liaison Committee with the professional review organizations will continue to work in your behalf. This is one group that needs the input of the physicians as well as the various societies and academies across the state to be able to express your concerns and problems to the professional review organizations.

7. The Liaison Committee with the North Carolina Academy of Family Physicians is currently addressing problems and concerns that the Academy has that have arisen over the past one to two years. They are diligently trying to solve these disputes and improve internal relations.

8. Liaison with the Auxiliary is a high-priority item. We feel that the Auxiliary is one of our richest resources and we are most appreciative of their efforts and want to utilize them more. We stand ready to help them help us in any way that we can. When we hear that they conducted

over 200 health related programs across the state last year, and they collected over \$40,000 through AMAERF for our four medical schools last year, we know that they are invaluable members of our team.

9. Over the last several years we have been impressed with the outstanding contribution that the Medical Students Section has made to the Society. Obviously the students are the physicians of the future and the ones who will be in our shoes soon. We want to help them in any way that we can so that the transition will be smooth when the time comes. We see that they need to be more involved now than ever before, because so many things are impacting on the health care system these days that will greatly influence their lives and practices a few years hence. We want the students and the resident physicians to know that we will support them in every way possible.

10. We want to work more closely with the Board of Medical Examiners generally, but especially with the expanded program of services for impaired physicians. We realize that this is an ever-increasing problem and we need to get a handle on this enigma or perplexing matter.

11. We hope to form closer alliances with specialty societies through the provision of administrative services as a headquarters function. We now have a formal relationship with six specialty societies and discussions are in progress now with two others, representing a total of 4,126 physicians across the state.

12. We will strive for closer association with the various divisions of the Department of Human Resources, which is deeply involved in the whole range of public health concerns, including AIDS. Also, we want to work closer with the Hospital Association, the Nurses Association, Physician Assistants, Medical Assistants, Medical Group Managers, and other health care professionals in North Carolina.

13. During the past year, we have been trying to repair some bridges between the North Carolina Medical Society and Blue Cross and Blue Shield of North Carolina.

At each Board of Trustees meeting of Blue Cross and Blue Shield, a report of North Carolina Medical Society activities has been presented, and I feel that the Board of Trustees of Blue Cross and Blue Shield is genuinely interested in the activities of the Medical Society and greatly respects the Medical Society and seeks input from us regarding medical care in North Carolina. I think our input to them can be directly beneficial to the 25% of the citizens of this state they insure, as well as indirectly helpful to the other 75% of the people of North Carolina. Four physicians who are members of the North Carolina Medical Society are members of that Board, plus one additional representative from the North Carolina Medical Society, usually the President-Elect. Recently, Blue Cross and Blue Shield requested that a committee of six other North Carolina Medical Society physicians be appointed to offer guidance about the administration of the State Health Plan. This has been accomplished.

Don't get the idea that this Ship of State is in trouble. Many, many more things are working well than are not. Things have been left in very good shape overall by my predecessors and I'm going to try to stick to the old principle, "If it ain't broke, don't fix it."

Do not conclude from these remarks that we will not address additional issues as they arise. We most assuredly will. But my first commitment to you is to strengthen what we already have and to position your state Medical Society to better serve the citizens of North Carolina as well as the North Carolina Medical Society membership.

Thank you again for the privilege of serving you as President this coming year. Please feel free to let me hear from you, in any way you wish, and about any concern you have. I need your guidance and your support. ■

FP, GP, PED

Needed now to work with an unique, internationally respected rural health system network in Kentucky which includes a hospital, satellite clinics, a home health agency and a school of advanced nursing. A regional medical center is within 20 miles. The practice environment is stimulating - physicians and ARNP's work in joint practice teams; interaction with students is encouraged; the rural population presents a great range and intensity of medical problems.

The setting is in heavily-wooded mountains with a moderate 4-season climate. Seven state parks are within 80 miles.

Superior compensation/benefits package includes a guaranteed salary with incentives and malpractice. Call Deborah Pennington COLLECT at 1-802-897-2556.

Address of the Outgoing Auxiliary President

to the North Carolina Medical Society House of Delegates

Pamela Sacco

If you have ever thought that the role the Auxiliary plays in medicine is a small one, that if we did not have an organization we would never be missed, consider that last year Auxilians implemented more than 200 health education programs and services in communities across North Carolina — programs that helped the public realize that physicians' families *care* about the people who live there.

Auxiliary Programs

Twenty-four programs for older Americans, including day care, education/social programs, friendly visiting, hospice, and meal programs.

Twenty-five programs for children and youth, including adolescent pregnancy, child abuse education and intervention, birth defects, and day care.

Forty-five community health programs, including blood donation, cancer education, school health education, AIDS education, screening, and nutrition.

Seventeen community service programs, including health fairs/exhibits, resource guides, and hospital hospitality houses.

Eight family life programs, including parenting, counseling, spouse abuse, and support groups.

Twelve health career programs, including loans and scholarships worth over \$27,000.

Fourteen child safety seat programs.

Twenty-two substance abuse programs, including alcohol, drugs, smoking, and impairment.

In addition, the counties raised more than \$41,000 for the American Medical Association Education and Research Foundation and contributed \$93,000 to community causes.

From the State Student Loan Fund, which grants up to \$2,000 to second-, third-, and fourth-year medical students, we provided \$12,000 in loans to seven students.

Joint ventures with the local county societies, once entirely social with occasional shared speakers, now include: health hotlines, educational workshops, benefit basketball games in which the physicians are the players as well as the cheerleaders, legislative forums and receptions, and even a joint long-range planning committee! These opportunities to involve physicians in their local communities are being created by Auxilians. Although these are achievements in which to take pride, they are only the beginning of what is needed between county medical societies and their auxiliaries to check the problems facing medicine.

I urge you as delegates to share with your county auxiliary the same kind of relationship the NCMSA shares with the NCMS. Members of the Executive Council as well as the headquarters staff offer their expertise, guidance, and services.

In contrast, our survey of county presidents indicates that only 15 make an annual report to their society and fewer than 35% attend their board of directors meetings. The time is right to acknowledge the Auxiliary's contribution by offering them this recognition in your local organizations.

Though we are not physicians, we are a visible segment of the medical profession and all that it stands for. Our neighbors and the general public regard us as such. We hope you do.

I submit that the Auxiliary is a first-class, high-powered, unique organization with a mission which stresses the advocacy of quality healthcare and health education for the people of North Carolina. It is your volunteer arm and it works for you and the communities in North Carolina.

An example is the MED-CARD project, which serves the communication needs among healthcare providers in our increasingly mobile society and in this era of alternative delivery systems. By carrying the MED-CARD in their wallet, patients in North Carolina will carry a complete list of currently taken prescription drugs. Nine county auxiliaries have already adopted this project which was introduced during Mid-Winter Conference.

The Auxiliary's mission also requires a supportive relationship among our members who are actively involved in

From P.O. Box 1086, Hendersonville 28793. This speech was delivered at the 133rd Annual Session of the North Carolina Medical Society, April 1987.

carrying out our programs. To that end we have established, in coalition with you, a Professional Liability Support Group which puts members in touch with physician/spouse "listeners" who have experienced the legal process and the impact of a lawsuit.

I think you will all agree that there is not enough money in the world to buy the kind of public relations that physician's spouses are capable of providing by demonstrating this caring concern in joint efforts.

Shakespeare said, "What is past is prologue." All of

these accomplishments are only the beginning. Our members await the challenge of tomorrow and are ready to become involved. We will not rest until we replace malpractice with gratefulness for longer and healthier lives.

Thank you for the confidence you have offered the Auxiliary by according us the privilege of addressing you today. Our pride comes from our identification with you. No other organization can claim to be a part of your ranks. It has made a difference! ■

TWO NIH CONSENSUS DEVELOPMENT CONFERENCES

Magnetic Resonance Imaging

A Consensus Development Conference on Magnetic Resonance Imaging, sponsored by the NIH Warren Grant Magnuson Clinical Center, Diagnostic Radiology Department and by the NIH Office of Medical Applications of Research, will be held in the Warren Grant Magnuson Clinical Center, National Institutes of Health, Bethesda, MD, October 26-28, 1987.

This open forum will focus on the efficacy of magnetic resonance imaging (MRI). It will address the following questions:

- Are there contraindications to or risks of MRI?
- What are the technological advantages and limitations (disadvantages) of MRI?
- What are the clinical indications for MRI, and how does it compare with other diagnostic modalities?
- What are the directions for future research in MRI?

NIH consensus conferences bring together biomedical investigators, practicing physicians, consumers, and representatives of public interest groups to provide a scientific assessment of drugs, devices, and procedures and to evaluate their safety and effectiveness. On the final day of the meeting, the consensus panel chairperson will read the draft statement before the conference audience and invite comments and questions.

To register for the conference, please contact Sharon Feldman, Prospect Associates, Suite 500, 1801 Rockville Pike, Rockville, MD 20852, 301/468-6555.

Geriatric Assessment Methods for Clinical Decision Making

The National Institute on Aging and the NIH Office of Medical Applications of Research, in collaboration with the National Institute of Mental Health, the Veterans Administration, and the Henry J. Kaiser Family Foundation of Menlo Park, CA, is sponsoring a consensus development conference on geriatric assessment methods for making clinical decisions. It will be held at the National Institutes of Health in Bethesda, MD, on October 19-21, 1987.

The care of older persons is becoming an ever-increasing responsibility for all but a few physicians and other health

care providers. Before practitioners can make reasonable judgments about the best care strategies for each older individual, it is clear that appropriate patient data must be collected.

The type of data and the methods for their collection can affect the outcome of geriatric care, improve the quality of life, and reduce overall health care costs. Because diseases in the older patient may present themselves differently, the geriatrician must conduct the assessment with an eye toward total care. Accurate diagnosis requires information about the person's functional capacity or ability to carry on daily activities. In addition, the health care provider will need to obtain certain data about the individual's social supports, personal resources, and environment. To this end, a body of knowledge is being amassed about the instruments and methodologies of geriatric assessment. Although information relevant to all of the above areas is needed under most circumstances, it is important that health professionals know which techniques are especially useful in one situation or another.

This conference will bring together physicians and other health care professionals with a special interest in geriatric medicine, social scientists, investigators in the area of health services research, and representatives of the public. Following one and a half days of presentations by leaders in the field and discussion by the audience, a consensus panel will weigh the scientific evidence and formulate a draft statement in response to the following questions:

- What are the goals, structure, processes, and elements of assessment for clinical decision making?
- What are the comparative merits of different methods in carrying out geriatric assessment?
- What is the evidence that a geriatric assessment is effective? If an assessment is effective, in what settings, for whom, and for which outcomes?
- Insofar as a geriatric assessment is effective, what linkages to clinical management systems are required?
- What are the priorities for future research in geriatric assessment?

On the final day of the conference, the consensus panel chairman will read the draft statement to the conference audience and invite comments and questions.

To register to attend the conference, please contact Ms. Marti Bernstein, Prospect Associates, 1801 Rockville Pike, Suite 500, Rockville, MD 20852, 301/468-6555.

Address of the Incoming Auxiliary President

to the North Carolina Medical Society Auxiliary

Jacqueline T. Snyder

I accept the challenge and the trust you have placed in me. This year I have discovered a "new dimension" of respect for all our state presidents. It is the past leadership that has set the standards for Auxiliary achievements today. Because each year builds upon previous ones, we will continue to incorporate their goals. We will ensure that the past accomplishments of the Auxiliary are preserved while at the same time initiating new ideas.

The history of the Auxiliary began as friendship and fellowship among physician spouses. It was organized at the recommendation of the president of the House of Delegates of the North Carolina Medical Society. Originally, the Auxiliary was called the Woman's Auxiliary to the Medical Society of the State of North Carolina. On April 18, 1923, Mrs. Paul P. McCain was acting chairman of the organizational meeting, which was held in Asheville. The Constitution and Bylaws were adopted and Sadie McCain of Southern Pines was elected president. The next meeting was held in Raleigh with dues set at \$1 per year. In 1925, although the social side of the Auxiliary was stressed, members began to desire a role of service to the community. To quote from "Medicine in North Carolina," Volume I: "Its members have become knowledgeable citizens, and outstanding leaders in varied fields. Cognizant of state health and welfare needs, the Auxiliary has attempted to reach new heights each year." That was written in 1969. In 1987-88 we will continue to climb the mountains in their footsteps.

My theme for this year is "Climb Every Mountain." Certain landscapes have the power to elevate the soul — you sense you can distinguish again between what is fundamentally important and what is mere frill in your life. There is no longer time for "frill" in Auxiliary life. We must accept the challenge to climb the mountains of revolution in health care and look to the future.

With this view from the mountain top of all the possibilities and potentials of a far-reaching Auxiliary, a unified

voice throughout the state, there is a need to draw our members into a close, supportive organization where spouses have an opportunity to work with their physicians to help medical education in their communities. Remember, "our image is a reflection of our service" (Betty Szewczyk, AMA Auxiliary President-Elect). It isn't always easy to keep up our image as the doctor's wife who is above reproach when we are constantly in the public eye. But we must not forget who we are, where we came from and why we are here. We are varied, we come from many backgrounds, cultures, civilizations, religious beliefs and customs. Yet — we do not fall into the mistake of collective rudeness which can be a crime against our good manners. We do not offend, insult, or intimidate our members by remaining ignorantly and blasé-ly aloof to those differences.

Do you think of yourself in terms of being loyal? Loyalty is an old-fashioned word that can seem outdated in our complex society. Yet never has a principle been more relevant to modern life and to our deepest needs. Loyalty is the quality of being faithful to a person, a belief, or an organization. Like love, loyalty enlarges and enriches both those who give it and those who receive it. Loyalty requires you to know what your values are. Loyalty asks you to stand up for what you believe in.

I need the help of everyone with loyalty and pride to make NCMS Auxiliary the best Auxiliary. This has been called a decade with no signature — the pervading factor has been change. I believe we are going to see even more dramatic changes in the next few years, not only in medicine, but also in Auxiliary. Keep in mind though, that without change, there is no growth — without growth, we start to die. Over the years every Auxiliary article across the nation has discussed challenges to be faced and changes to be coped with, but we have lived and changed with them. The dream of Auxiliary is not going to die with us because of these changes — it will continue with us as we climb those mountains. "We must see that the challenges that confront us on every hand do not erode the traditions we hold dear, but rather, that we see those challenges as the means through which our unified efforts become more rel-

From 378-A Pine Ridge Drive, Whispering Pines 28327. This speech was delivered at the 64th Annual Convention of the North Carolina Medical Society Auxiliary, May 1987.

evant to our times and more effective for those people we seek to serve" (Mary Kay McPhee, Immediate Past President, AMA Auxiliary).

We must continue with the NCMS Auxiliary initiatives for health in aging, substance abuse, human abuse, parenting, adolescents, legislation, smokeless tobacco and health care costs. Our physician spouses are expected to produce the impossible, but when the problem is not solved then the public concludes it must have been negligence or malpractice. We will continue to work to enhance the physician image and change the public image of medicine. We will work closely with our medical societies and become knowledgeable about changing health care. In legislation, we must help to pass tort reform so this crisis will not change medical care as we know it today. We must also create avenues of support for those whose spouses are involved in malpractice litigation. We will increase our AMA-ERF and state student loan efforts to raise funds for medical students and schools.

Since one-third of the medical school graduates are women, we can no longer tailor our membership programs to women, but will target male spouses as well. With one-fourth of the physician families working outside the home, we will have meaningful programs for the career spouse. We will continue special support to resident physician spouses and encouragement of members-at-large. We best serve the 35-45 age group, so now we need to place special emphasis on spouses of retired physicians and widows. We will encourage all these levels of membership because in this age of competition, we must make Auxiliary so prestigious that people will look forward to joining it as their main priority. We have the potential of being the very top of the line among the effective volunteer networks in place today.

With the mountain of change there will be an increasing number of community health areas which will need volunteer efforts to bridge the gaps from federal spending. These are the health services and areas of concern targeted for 1987-88.

1 AIDS education: Aids has continued to grow as a major public health problem. In cooperation with the medical societies, we will be involved in an AIDS health education program.

2 Substance abuse: *Smokeless Tobacco.* We will actively support programs which educate the public, especially youth, about the danger of using smokeless tobacco. "*Crack.*" We will raise the awareness level about the growing use of cocaine in the Carolinas. For years, cocaine has been the "drug of choice" for the social and moneyed elite, but "crack" has now invaded all segments of our society.

3 Human abuse: *The shaking shocker.* Medical studies and statistical evidence give witness to the severity of damage caused by shaking or throwing a child in the air. We will provide education on child whiplash syndrome or brain trauma. (This is not necessarily a case of abuse, but may be done in ignorance by those who are unaware of these serious consequences.)

4 Aging: *Suicide of the elderly.* Elderly Americans take their lives far more often than adolescents, and their suicide rate is more than 50% above that of the general population.

5 Impairment: *The physician spouse.* Alcohol, marijuana, and cocaine are the primary drugs that affect all homes — including the physician spouse in the medical family. In this time of stress within the medical community, we will emphasize the concept of auxiliary as a support group.

NCMS Auxiliary has concerned itself with many valuable health issues in the past, and all of them remain vital to the good health of our country's population. Since one program or project may not be enough to reinforce an issue, nor will everyone be reached at first, we must continue to educate community members about all of these ongoing health problems. We do not discard viable programs, but each year we offer resource material or additional areas so that the Auxiliary will always be in the forefront of current needs and trends.

I know that the definition of a good speech is a beginning and a conclusion — not too far apart. I will close with a reminder of one of our Auxiliary concepts. When Edmund Hillary and native guide, Tenzing, climbed Mount Everest, Hillary suddenly lost his footing. Tenzing held the line taut and kept them both from falling by digging his axe into the ice. Later, Tenzing refused any credit for saving Hillary's life. As he put it: "Mountain climbers always help each other." Should we be any different? ■

PHYSICIANS, SCHEDULE SOME TIME FOR YOUR COUNTRY.

Many physicians would like to devote some time to their country in a local Army Reserve unit. We know that making a weekend commitment can be difficult for most physicians. So it is practical for the Army Reserve units to be flexible about time. It's worth discussing.

Incidentally, in addition to satisfying your own desire to serve your country, there are exceptional opportunities to do something totally different from a day-to-day routine. Opportunities to study new areas of medicine, meet new people in your specialty, and be a part of one of the world's most advanced medical teams.

Discuss the opportunities with our Army Medical Personnel Counselor.

FOR SURGEONS LOOKING FOR A CHALLENGE.

Your challenge could be the Army Reserve unit near you. It's a unit that requires the services of surgeons.

You may wish to explore the challenge of teaching in a major medical center. You may wish to explore the special challenges of your specialty in triage. Certainly you'll be confronted by challenges very different from your daily routine.

You'll also have an opportunity to participate in a number of programs in which you'll be able to exchange views and information with other surgeons from all over the country.

The Army Reserve understands the time demands on a busy physician, so you can count on us to be totally flexible in making time for you to share your specialty with your country. We'll arrange your training program to work with your practice.

To find out about the benefits of serving with a nearby Army Reserve unit, we recommend you call our Army Medical Personnel Counselor.

PHYSICIANS, THERE ARE TWO KINDS OF FLEXIBILITY IN THE ARMY RESERVE WE THINK YOU'LL LIKE.

One, time. We know how tough it is for a busy physician to make weekend time commitments. So we offer flexible training programs that allow a physician to share some time with his or her country. We arrange a schedule to suit your requirements.

Two, the opportunity to explore other phases of medicine, to add a different kind of knowledge—the challenge of military health care. It's a flexibility which could prove to be both stimulating and rewarding, with the opportunity to participate in a variety of programs that can put you in contact with medical leaders from all over the country.

See how flexible we can be, call our Army Medical Personnel Counselor.

**ARMY RESERVE.
BE ALL YOU CAN BE.**

HERE'S ONE DOCTOR WHO WON'T PAY HIS MALPRACTICE PREMIUMS THIS YEAR.

The Army covers his premiums. Since he's an Army Physician, there are a lot of worries associated with private practice that he won't have to contend with. Like excessive paperwork, and the overhead costs incurred in running a private practice.

What he will get is a highly challenging, highly rewarding experience. The Army offers varied assignments, chances to specialize, or further your education, and to work with a team of dedicated health care professionals. Plus a generous benefits package.

If you're interested in practicing high quality health care with a minimum of administrative burdens, examine Army medicine. Talk to your local Army Medical Department Counselor for more information.

Letters to the Editor

Internist's Lament

To the Editor:

For as long as I can remember, there has been a problem in allowing terminal or elderly patients to die with dignity in a hospital. I am not sure that recent legislation has helped much. Unless I am misinformed, legislation was supposed to make it easier to die in the hospital when hope was lost. I feel that our hospitals have interpreted the law in a manner that protects themselves rather than the patients' dignity. I am not certain that protection [of hospitals] is necessary. I realize that we need rules and policies, but I sometimes think that rules lack common sense.

Let me clarify with examples. Dr. _____ tells me that at one time he was asked to return to the hospital at night to write an order that specifically stated "No Code." The words "do not resuscitate" were not sufficient. I have had the same experience. This week I was called by a nursing supervisor to come in to the hospital and rewrite a "No Code" order. An appropriate "No Code" was written when the patient was in the Intensive Care Unit. The supervisor stated that it was "hospital policy" to rewrite a "No Code" order after the patient was transferred to the floor. I am sure that most Internists have witnessed the deterioration of an elderly patient in the middle of the night and were required by "hospital policy" to come in and write the "No Code" order. No verbal orders would be allowed. The elderly patient dying of cancer would be coded if he [the doctor] did not personally come in and write the order.

I wonder if our legislators really intended for the law to be interpreted so rigidly. Is the hospital's concern about legal protection by a hand-written order valid? Is there really legal precedent for this concern? Do all hospitals interpret the state legislation as rigidly as ours? Have we really provided the patient with greater dignity or have we created a bureaucratic nightmare that decreases rapport between the nursing staff and medical staff?

It is this Internist's feeling that something is wrong when "hospital policy" supersedes all good common medical sense. Physicians used to be adept at cutting through the red tape and eliminating the depersonalization of health care. I feel that we should change hospital dictums that run contrary to common sense. How do we do so?

A comment on Fort and Grigg's article

To the Editor:

The paper on carbon monoxide (CO) poisoning by Fort and Griggs (Carbon Monoxide Poisoning in North Carolina

1987;48:317-21) is important because of the prevalence of the problem. The paper is useful for the lay person, however, I think several points should be made for the benefit of medical people who may use this as a reference.

As mentioned, carbon monoxide certainly binds to hemoglobin, but of more importance is the fact that it also binds to other iron-containing proteins such as myoglobin and the cytochromes. Even very high carboxyhemoglobin (COHb) levels do not usually produce serious morbidity, but the principle toxic effects of CO result from its attachment to cytochrome A3 in the cell mitochondria. In humans about 15% of the body store of CO will be found outside the vascular system and the CO which is physically dissolved in the blood is more important than absolute COHb levels.

It is very difficult to accurately assess the severity of carbon monoxide poisoning. The table of COHb levels and effects as presented by the authors has been in the literature for many years. However, there is no correlation between symptoms, severity of exposure and levels of carboxyhemoglobin. A long exposure to low levels of carbon monoxide may be more harmful than a short exposure to high levels. A patient with a level below 20% may be comatose while another patient with a level close to 50% is unimpaired. COHb levels when obtained after a delay or treatment with oxygen may be normal and not reflect the true insult.

The decision about diagnosis depends on observation and physical evaluation of the patient. The patient should be treated according to clinical status. If a hyperbaric facility is readily available it should be utilized. Even mildly poisoned patients will gain significant relief. Due to the enhanced vulnerability of the fetus, treatment for the pregnant patient should be liberal. The criteria for treatment following carbon monoxide exposure are simple. Any degree of cerebral obtundation (may be subtle) and/or a carboxyhemoglobin level greater than 20% warrants immediate treatment with hyperbaric oxygen. Remember that if the patient has been receiving oxygen, the half-life of CO is reduced and the carboxyhemoglobin level may give a false impression. It cannot be overemphasized that a COHb value within normal limits does not rule out a significant case of CO poisoning.

Hyperbaric oxygen treatment of carbon monoxide poisoning immediately corrects tissue hypoxia, increases the rate of carbon monoxide elimination from the body, and provides a beneficial effect on cerebral edema. The common opinion that a patient having survived exposure to carbon monoxide has a good prognosis is invalid and should not discourage consideration for optimum therapy. Hyperbaric oxygen may prevent long rehabilitation and serious sequelae.

Emergency consultation may be obtained by calling 919/684-8111 at Duke University Medical Center and asking for the Divers Alert Network (DAN) hyperbaric physician on call. DAN maintains liaison with all the active hyperbaric chambers in North America and the Caribbean and can arrange referral regardless of the patient's location.

A comment on the article by Dr. Aluise et al.

To the Editor:

An article which appeared in the June issue of the Journal, "Implications for Fee-for-Service Practices Affiliated with Independent Practice Associations" (Aluise JJ, Bradley D, Zelman B, 48:334-8), listed several sources of information for physicians who are considering contracting with HMOs. I would like to acquaint your readers with another — Medical Advocacy Services, Inc. (MASI), a subsidiary of the

American Society of Internal Medicine. MASI was organized in January 1986 to provide contract analysis and negotiation assistance to physicians of all specialties. To date, we have analyzed contracts for physicians in 37 states.

Common problems found by MASI in physician contracts include ambiguous clauses regarding turnaround time for payment of claims; references to policies and procedures that are not included as part of the contract but with which the physician is expected to comply; and clauses which allow for arbitrary termination of physicians or commit physicians to outstanding obligations after their participation in the plan has ended. A careful evaluation of the legal and practical implications of participation in a particular plan frequently reveals that it is not a good deal from the physician's standpoint or that certain changes should be made in the contract in order to strengthen the physician's position vis-a-vis the health plan.

Physicians interested in more information about the services available through MASI can write or call: Medical Advocacy Services, Inc., 1101 Vermont Avenue, NW, Suite 500, Washington, DC 20005; 202/289-0027 (collect).

Continuing Medical Education

Please note: The Continuing Medical Education Programs at Bowman Gray, Duke, East Carolina (ECU) and UNC Schools of Medicine, and Dorothea Dix are accredited by the American Medical Association. Therefore CME programs sponsored or cosponsored by these schools automatically qualify for AMA Category 1 credit toward the AMA's Physician Recognition Award, and for North Carolina Medical Society Category A credit. Where AAFP credit has been obtained, this also is indicated.

AUTHORS

INSTRUCTIONS FOR SUBMITTING PAPERS

Copyright of an article published in the *North Carolina Medical Journal* is retained by the author, but the copyright to each entire issue is the property of The North Carolina Medical Society, and permission to reprint all or any part of a published article must be negotiated with the author and the editor jointly. The reprinted material must carry a credit line signifying that it appeared in the *North Carolina Medical Journal*.

Medical articles, editorials, patient oriented articles, letters to the editor and all other text submitted for publication must be double-spaced throughout, including references and legends. The material should be typed on one side of the paper with 1 1/4 inch margins all around. Do not use an all-caps or a script typeface. Submit one original and one copy. Please be sure to include your phone number.

The author is responsible for the accuracy of all statements and references. Acronyms and other abbreviations should be kept to a minimum; *any acronym used should be fully translated in the text*. Refer to pharmaceutical products by their generic names; brand names may follow in parentheses. Units of measure should appear in the metric system. References, typed double-spaced, should be listed in the order of their citation in the text, not alphabetically. They should follow the style used in the *Journal*.

Illustrations should be black and white glossy prints or color or black and white slides, with legends typed in double-space on a separate sheet of paper. Since the *Journal* has a limited budget for color, it may be a factor in publishing color illustrations.

Attach to the two copies of the manuscript a cover letter giving the address and telephone number of the person who will correspond about it, and address the completed communication to the Editor, Box 3910, Duke University Medical Center, Durham, NC 27710.

All manuscripts are subject to editorial changes. If extensive revision is necessary, the author will receive a draft of the edited article for approval before publication.

Authors interested in more effective writing may find *The Elements of Style* by Strunk and White and *How to Write and Publish a Scientific Paper* by Day helpful.

Extracted, with permission, from *Virginia Medical* with thanks.

LIBRIUM® (TV)

chlordiazepoxide HCl/Roche

5-mg, 10-mg, 25-mg capsules

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Management of anxiety disorders; short-term relief of anxiety symptoms, acute alcohol withdrawal symptoms, preoperative apprehension and anxiety. Usually not required for anxiety or tension associated with stress of everyday life. Efficacy beyond four months not established by systematic clinical studies. Periodic reassessment of therapy recommended.

Contraindications: Known hypersensitivity to the drug.

Warnings: Warn patients that mental and/or physical abilities required for tasks such as driving or operating machinery may be impaired, as may be mental alertness in children, and that concomitant use with alcohol or CNS depressants may have an additive effect. Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage. Withdrawal symptoms (including convulsions) reported after abrupt cessation of extended use of excessive doses are similar to those seen with barbiturates. Milder symptoms reported infrequently when continuous therapy is abruptly ended. Avoid abrupt discontinuation; gradually taper dosage.

Usage in Pregnancy: Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically. Due to isolated reports of exacerbation, use with caution in patients with porphyria.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for maximum beneficial effects. *Oral—Adults:* Mild and moderate anxiety disorders and symptoms, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. *Geriatric patients:* 5 mg b.i.d. to q.i.d. (See Precautions).

Supplied: Librium® (chlordiazepoxide HCl/Roche) Capsules, 5 mg, 10 mg and 25 mg—bottles of 100 and 500; Tel-E-Dose® packages of 100, available in boxes of 4 reverse-numbered cords of 25, and in boxes containing 10 strips of 10. Libritabs® (chlordiazepoxide/Roche) Tablets, 5 mg and 10 mg—bottles of 100 and 500; 25 mg—bottles of 100. With respect to clinical activity, capsules and tablets are indistinguishable.

AIM HIGH

A SPECIAL PRACTICE F O R SPECIALISTS

★

If you're a **Surgeon** or **OB/GYN** or **Other Medical Specialist**, the Air Force may have a special practice for you.

What makes it special? You'll enjoy an excellent pay and benefits package. There'll be more time to spend with your family. You'll receive 30 days of vacation with pay each year. And you will work with modern equipment and some of the most highly trained professionals in the world, serving your country and your patients. Now that's special!

Find out just how special your practice can be. Call

Capt Jim Davis
(919) 850-9475 collect

**AIR
FORCE**

Let's get to the "heart" of the matter.
You want a "No Risk" System for your practice, and Med-Care has it!

Med-Care is the powerful office management system created for medical practices and clinics. Med-Care will improve the efficiency and productivity of managing and processing patient information while *improving cash flow*. In short, it will help you manage virtually every aspect of your practice.

The Med-Care System automates labor intensive functions like insurance processing, accounts receivable, billing, appointment scheduling and even routine correspondence. Med-Care has alternate fee schedules to help speed up your patient processing. HMOs and other PHP plans are handled with ease. It is also an invaluable business analysis tool, providing the insight you need to make well-informed decisions about the performance and future growth of your practice.

But what you'll appreciate most about The Med-Care System is its simplicity. A basic knowledge of bookkeeping, billing, and insurance claim procedures is all the experience you need.

A Complete Management System Designed in Cooperation with Medical Professionals.

The reason for The Med-Care System's superior performance and simple operation is that we designed it in cooperation with the medical industry, not just systems programmers, but physicians, medical accountants and medical office managers — people with the real knowledge and understanding of medical office management.

Unless you have an insight into computers and software, selecting the right system as well as the proper support and training can be a difficult, time-consuming and very expensive experience. To make things easier on you, The Med-Care System was developed as a complete system. Everything you need — software, hardware, training and support — is included.

The Med-Care System comes complete with the Medical Office Management Program, Texas Instruments Micro or Mini System Computer with multiple work stations, printers and high capacity disk drives. Each system is tailored to the specific needs of your practice. And as your practice grows, Med-Care is flexible enough to grow with you.

The Texas Instruments Computers are expandable and support up to 128 workstations with the ability to expand storage as it is needed. They were selected for their price-performance and reliability in group practice environments.

Every Aspect of Your Practice Will Run More Efficiently.

Med-Care software is so versatile, you can tailor it to every management function in your practice. And even if you've never used a computer before, automating your practice with The Med-Care System is simple.

Med-Care's one-time data entry function is another time-saving feature. Because it's totally interactive throughout, you never need to enter the same data more than once.

Here are some of the ways Med-Care can improve the way you manage your practice:

- Speeds up insurance processing by handling multiple claims per patient and can transmit paperless claims to Medicare and major carriers.
- Improves staff management by maintaining information for multiple doctors and locations.
- Reduces collection time by tracing unpaid insurance claims.
- Increases efficiency by aging accounts and insurance pending files automatically.

- Eliminates paperwork by generating daily charge tickets and appointments.
- Increases cash flow by printing statements, medical reminders and collection letters.
- Improves patient service by providing instant access to each patient's medical records.
- Reduces paperwork by generating daily, monthly, or yearly receipt and charge reports by doctor, by procedure and by practice.

Med-Care's Person-To-Person Training: A Nice Way To Get Started.

Before you invest in a medical office management system, it's important to know what you're getting for your money. With The Med-Care System, what you get is more than hardware and software. You get the personal care and attention that has become a trademark of the people at Med-Care.

The moment your system arrives, the people at Med-Care will be there to guarantee a smooth, trouble-free start-up. They'll take you through an informative five-day practice clinic to ensure that everyone feels comfortable and confident with the new system. It's a nice way to get started.

But that's only the beginning. The people at Med-Care help you throughout the year. Our qualified customer service staff is specially trained on the Med-Care System. If you ever have trouble, they'll respond immediately.

We'd like to show you how simple it is to put Med-Care to work for your practice.

In just 30 minutes the system can be demonstrated at no cost or obligation to you. You'll get to see firsthand how The Med-Care System has helped many practices like yours to improve cash flow, increase productivity, and most importantly, improve the overall management of their patients.

All of these things are why Med-Care is the "No Risk" medical practice system for you.

**Serving the MEDICAL PROFESSION of NORTH CAROLINA
and SOUTH CAROLINA since 1919.**

We equip many physicians beginning practice each year and invite your inquiries.

Our salesmen are located in all parts of North Carolina.

*We have DISPLAYED at every N.C. State Medical Society Meeting since 1921
and advertised CONTINUOUSLY in the N.C. Journal since January 1940 issue.*

See the difference in the first week¹

- Sleep improvement in 74% of patients after first h.s. dose²
- Significantly faster relief—62% of total four-week improvement evident in first week versus 44% with amitriptyline alone¹
- Dramatic first-week reduction in somatic complaints²

% Reduction in Somatic Symptoms²

Vomiting	Nausea	Headache	Anorexia	Constipation
Reduced 90%	Reduced 86%	Reduced 72%	Reduced 62%	Reduced 60%

- Only 1/3 the dropout rate due to side effects of amitriptyline alone, although the incidence of side effects is similar¹

Caution patients about the combined effects of Limbitrol with alcohol or other CNS depressants and about activities requiring complete mental alertness, such as operating machinery or driving a car. In general, limit dosage to the lowest effective amount in elderly patients.

In moderate depression
and anxiety

Limbitrol[®]

Each tablet contains 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt) ^(IV)

Limbitrol[®] DS

Each tablet contains 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt) ^(IV)

References: 1. Feighner JP, et al. *Psychopharmacology* 61: 217-225, Mar 22, 1979 2. Data on file, Hoffmann-La Roche Inc., Nutley, NJ

Limbitrol[®] ^(IV) Tranquilizer—Antidepressant

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Relief of moderate to severe depression associated with moderate to severe anxiety
Contraindications: Known hypersensitivity to benzodiazepines or tricyclic antidepressants. Do not use with monoamine oxidase (MAO) inhibitors or within 14 days following discontinuation of MAO inhibitors since hyperpyretic crises, severe convulsions and deaths have occurred with concomitant use, then initiate cautiously, gradually increasing dosage until optimal response is achieved. Contraindicated during acute recovery phase following myocardial infarction

Warnings: Use with great care in patients with history of urinary retention or angle-closure glaucoma. Severe constipation may occur in patients taking tricyclic antidepressants and anticholinergic-type drugs. Closely supervise cardiovascular patients (Arrhythmias, sinus tachycardia and prolongation of conduction time reported with use of tricyclic antidepressants, especially high doses. Myocardial infarction and stroke reported with use of this class of drugs.) Caution patients about possible combined effects with alcohol and other CNS depressants and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving).

Usage in Pregnancy: Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Since physical and psychological dependence to chlordiazepoxide have been reported rarely, use caution in administering Limbitrol to addiction-prone individuals or those who might increase dosage, withdrawal symptoms following discontinuation of either component alone have been reported (nausea, headache and malaise for amitriptyline, symptoms [including convulsions] similar to those of barbiturate withdrawal for chlordiazepoxide).

Precautions: Use with caution in patients with a history of seizures, in hyperthyroid patients or those on thyroid medication, and in patients with impaired renal or hepatic function. Because of the possibility of suicide in depressed patients, do not permit easy access to large quantities in these patients. Periodic liver function tests and blood counts are recommended during prolonged treatment. Amitriptyline component may block action of guanethidine or similar antihypertensives. When tricyclic antidepressants are used concomitantly with cimetidine (Tagamet), clinically significant effects have been reported involving delayed elimination and increasing steady state concentrations of the tricyclic drugs. Concomitant use of Limbitrol with other psychotropic drugs has not been evaluated, sedative effects may be additive. Discontinue several days before surgery. Limit concomitant administration of ECT to essential treatment. See Warnings for precautions about pregnancy. Limbitrol should not be taken during the nursing period. Not recommended in children under 12. In the elderly and debilitated, limit to smallest effective dosage to preclude ataxia, oversedation, confusion or anticholinergic effects.

Adverse Reactions: Most frequently reported are those associated with either component alone: drowsiness, dry mouth, constipation, blurred vision, dizziness and bloating. Less frequently occurring

reactions include vivid dreams, impotence, tremor, confusion and nasal congestion. Many depressive symptoms including anorexia, fatigue, weakness, restlessness and lethargy have been reported as side effects of both Limbitrol and amitriptyline. Granulocytopenia, jaundice and hepatic dysfunction have been observed rarely.

The following list includes adverse reactions not reported with Limbitrol but requiring consideration because they have been reported with one or both components or closely related drugs.

Cardiovascular: Hypotension, hypertension, tachycardia, palpitations, myocardial infarction, arrhythmias, heart block, stroke

Psychiatric: Euphoria, apprehension, poor concentration, delusions, hallucinations, hypomania and increased or decreased libido

Neurologic: Incoordination, ataxia, numbness, tingling and paresthesias of the extremities, extrapyramidal symptoms, syncope, changes in EEG patterns

Anticholinergic: Disturbance of accommodation, paralytic ileus, urinary retention, dilatation of urinary tract

Allergic: Skin rash, urticaria, photosensitization, edema of face and tongue, pruritus

Hematologic: Bone marrow depression including agranulocytosis, eosinophilia, purpura, thrombocytopenia

Gastrointestinal: Nausea, epigastric distress, vomiting, anorexia, stomatitis, peculiar taste, diarrhea, black tongue

Endocrine: Testicular swelling and gynecomastia in the male, breast enlargement, galactorrhea and minor menstrual irregularities in the female, elevation and lowering of blood sugar levels, and syndrome of inappropriate ADH (antidiuretic hormone) secretion

Other: Headache, weight gain or loss, increased perspiration, urinary frequency, mydriasis, jaundice, alopecia, parotid swelling

Overdosage: Immediately hospitalize patient suspected of having taken an overdose. Treatment is symptomatic and supportive. IV administration of 1 to 3 mg physostigmine salicylate has been reported to reverse the symptoms of amitriptyline poisoning. See complete product information for manifestation and treatment.

Dosage: Individualize according to symptom severity and patient response. Reduce to smallest effective dosage when satisfactory response is obtained. Larger portion of daily dose may be taken at bedtime. Single h.s. dose may suffice for some patients. Lower dosages are recommended for the elderly. Limbitrol DS (double strength) Tablets, initial dosage of three or four tablets daily in divided doses, increased up to six tablets or decreased to two tablets daily as required. Limbitrol Tablets, initial dosage of three or four tablets daily in divided doses, for patients who do not tolerate higher doses.

How Supplied: Double strength (DS) Tablets, white, film-coated, each containing 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt), and Tablets, blue, film-coated, each containing 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt). Available in bottles of 100 and 500. Tel-E-Dose[®] packages of 100, Prescription Paks of 50

Let's get to the "heart" of the matter.
You want a "No Risk" System for your practice, and Med-Care has it!

Med-Care is the powerful office management system created for medical practices and clinics. Med-Care will improve the efficiency and productivity of managing and processing patient information while *improving cash flow*. In short, it will help you manage virtually every aspect of your practice.

The Med-Care System automates labor intensive functions like insurance processing, accounts receivable, billing, appointment scheduling and even routine correspondence. Med-Care has alternate fee schedules to help speed up your patient processing. HMOs and other PHP plans are handled with ease. It is also an invaluable business analysis tool, providing the insight you need to make well-informed decisions about the performance and future growth of your practice.

But what you'll appreciate most about The Med-Care System is its simplicity. A basic knowledge of bookkeeping, billing, and insurance claim procedures is all the experience you need.

A Complete Management System Designed in Cooperation with Medical Professionals.

The reason for The Med-Care System's superior performance and simple operation is that we designed it in cooperation with the medical industry, not just systems programmers, but physicians, medical accountants and medical office managers — people with the real knowledge and understanding of medical office management.

Unless you have an insight into computers and software, selecting the right system as well as the proper support and training can be a difficult, time-consuming and very expensive experience. To make things easier on you, The Med-Care System was developed as a complete system. Everything you need — software, hardware, training and support — is included.

The Med-Care System comes complete with the Medical Office Management Program, Texas Instruments Micro or Mini System Computer with multiple work stations, printers and high capacity disk drives. Each system is tailored to the specific needs of your practice. And as your practice grows, Med-Care is flexible enough to grow with you.

The Texas Instruments Computers are expandable and support up to 128 workstations with the ability to expand storage as it is needed. They were selected for their price-performance and reliability in group practice environments.

Every Aspect of Your Practice Will Run More Efficiently.

Med-Care software is so versatile, you can tailor it to every management function in your practice. And even if you've never used a computer before, automating your practice with The Med-Care System is simple.

Med-Care's one-time data entry function is another time-saving feature. Because it's totally interactive throughout, you never need to enter the same data more than once.

Here are some of the ways Med-Care can improve the way you manage your practice:

- Speeds up insurance processing by handling multiple claims per patient and can transmit paperless claims to Medicare and major carriers.
- Improves staff management by maintaining information for multiple doctors and locations.
- Reduces collection time by tracing unpaid insurance claims.
- Increases efficiency by aging accounts and insurance pending files automatically.

- Eliminates paperwork by generating daily charge tickets and appointments.
- Increases cash flow by printing statements, medical reminders and collection letters.
- Improves patient service by providing instant access to each patient's medical records.
- Reduces paperwork by generating daily, monthly, or yearly receipt and charge reports by doctor, by procedure and by practice.

Med-Care's Person-To-Person Training: A Nice Way To Get Started.

Before you invest in a medical office management system, it's important to know what you're getting for your money. With The Med-Care System, what you get is more than hardware and software. You get the personal care and attention that has become a trademark of the people at Med-Care.

The moment your system arrives, the people at Med-Care will be there to guarantee a smooth, trouble-free start-up. They'll take you through an informative five-day practice clinic to ensure that everyone feels comfortable and confident with the new system. It's a nice way to get started.

But that's only the beginning. The people at Med-Care help you throughout the year. Our qualified customer service staff is specially trained on the Med-Care System. If you ever have trouble, they'll respond immediately.

We'd like to show you how simple it is to put Med-Care to work for your practice.

In just 30 minutes the system can be demonstrated at no cost or obligation to you. You'll get to see firsthand how The Med-Care System has helped many practices like yours to improve cash flow, increase productivity, and most importantly, improve the overall management of their patients.

All of these things are why Med-Care is the "No Risk" medical practice system for you.

THE MEDICAL SECRETARY'S OFFICE SYSTEM

Finally — First time ever, forms processing software perfectly customized for medical offices' applications. Cut forms processing time in half!!!!!!

We are offering to let you use a **PROTYPE FREE** for one week. If you think it's impossible for a typewriter to cut a **medical secretary's** typing time in half, we understand.

That's why we're offering to let you prove it for yourself.

DESIGNED FOR THE MEDICAL OFFICE, the PROTYPE is your typewriter. It's your word processor, it is compatible with your personal computer. The PROTYPE is truly unique.

ZIPS THROUGH FORMS. Our machine is the greatest medical forms processing machine ever invented. Even new forms, with many carbons can be put into the the PROTYPE and processed quickly and accurately. No need to erase!

The DATAPRO REPORT:
"It's almost perfect."

NEWSWEEK: "Its ease of operation may be its greatest advantage."

POWER OF A WORD PROCESSOR: You can change it, delete it, fix it, rearrange it — and if you really mess up — our magic "**UNDO**" key will wonderfully put everything back just like it was before.

It's a special typewriter and word processor and form processing system and companion to a personal computer—who ever heard of a typewriter that shares PC files—what is done on a personal computer can be transferred to the PROTYPE—and vice versa

CALL TODAY AND ASK FOR YOUR FREE TRIAL. Oh, yes it does have a 62,000 word spelling dictionary, line drawing, linear graphics included.

Now America's oldest professional liability insurer has come to North Carolina.

The newest professional liability insurer in North Carolina is the oldest in the nation. The Medical Protective Company pioneered the concept of professional protection before the turn of the century and has been serving doctors exclusively ever since. Through good times and bad.

With the current liability crisis escalating, you need to take a close look at your coverage and the company that stands behind it. Then take a close look at us. You'll see we carry the highest

rating from A.M. Best, the firm that tracks the financial stability of insurance companies nationwide. Beyond that, you'll find complete protection at premium rates that are likely lower than you're currently paying. Plus the personal attention and claims prevention assistance you deserve.

Contact Stu Mitchelson today at 704/541-8020. He's the oldest company's representative in its newest state. And he's here to serve you.

About the Guest Editor

Robert S. Sandler, M.D., M.P.H.

Dr. Sandler, Assistant Professor of Medicine and Clinical Assistant Professor of Epidemiology at the University of North Carolina at Chapel Hill, graduated from the Yale University School of Medicine in 1975. He completed training in internal medicine at the George Washington University School of Medicine and in gastroenterology at the University of North Carolina at Chapel Hill. Following completion of his GI fellowship, Dr. Sandler attended the UNC School of Public Health where he received an M.P.H. in epidemiology in 1982. He has been the recipient of a Junior Faculty Clinical Fellowship from the American Cancer Society and a Preventive Oncology Academic Award from the National Cancer Institute. His research interests concern cancer etiology, screening, and prevention, as well as the epidemiology of chronic digestive conditions.

Why is a gastroenterologist the guest editor of an issue on breast cancer? Dr. Sandler has been an active member of the North Carolina Division of the American Cancer Society where he serves as chairman of the Professional Education Committee and as chairman of the ad hoc committee on Breast Cancer Detection Awareness (BCDA). The BCDA committee thought that an excellent way to launch the breast cancer education program in North Carolina would be through the *North Carolina Medical Journal*. As chairman of the BCDA committee, and as someone with a strong commitment to cancer prevention, Dr. Sandler enthusiastically agreed to serve as editor.

Breast Cancer Awareness

Robert S. Sandler, M.D., M.P.H.

This issue of the *North Carolina Medical Journal* is devoted to detection and management of breast cancer. The issue launches a three-year effort by the North Carolina Division of the American Cancer Society to increase breast cancer detection awareness by physicians and the public. The articles, which deal with a broad range of topics, have each been contributed by American Cancer Society volunteers who are involved in the Breast Cancer Detection Awareness Program.

The rationale behind the breast cancer effort is obvious. Breast cancer is distressingly common and frequently fatal. Although some progress has been made in early detection and treatment, the mortality rate is far higher than it should be. If women and their physicians took advantage of currently available diagnostic techniques, the story would be different. There is clear evidence that early detection is associated with prolonged survival and less disfiguring surgery, but most women do not take advantage of opportunities for early detection.

There are several specific steps that we as physicians can take to improve the picture. First, we can emphasize the importance of breast self exams and teach the technique. Most breast cancers are now discovered by women themselves. By learning the technique of breast self exam, women will enable themselves to appreciate the normal characteristics of their breasts and to detect departures from the normal more quickly. The article by Hayes in the "For Patients" section of the *Journal* describes the technique of breast self examination. Second, we can perform more diligent exams ourselves. O'Malley and Fletcher provide some important information about the clinical breast exam. Their most significant message, while not unexpected, is crucial nonetheless — the more time we spend on the examination, the more lesions we detect. While the busy practitioner may find it difficult to spend the time needed, perhaps other health professionals can be recruited for the task. Finally, we should be certain that women take advantage of mammography. As pointed out by Bertrand et al., there are several studies which document the survival advantage conferred by early detection. Most women have not had a mam-

mogram because of concerns about risk, expense and effectiveness. With the current generation of low dose mammography equipment, the falling costs, and the clear improvements in survival with cancers discovered by mammography, these concerns are unfounded.

The American Cancer Society is currently promoting Breast Cancer Detection Awareness, but once a cancer is detected, what can be done for the patient? Several articles in this special issue provide timely information. Newsome outlines some of the factors that dictate current surgical management of breast cancer based on the biology of the disease. In the past, breast cancer inevitably led to mastectomy. We currently understand that less extensive operations are appropriate in many instances. Ferree discusses the important role of radiation therapy in the management of the breast cancer patient, and Bernard reviews the role of chemotherapy. The article by Georgiade et al. on breast reconstruction highlights the potential of plastic surgery to improve the well-being of women who require mastectomy. Finally, Lannin suggests an approach for the follow-up of breast cancer patients. The risk of recurrence does not end after five years as with most other cancers. We might adopt the approach suggested by Lannin to follow these patients.

What about the future? Our most important need at present is to understand the factors which initiate and promote breast cancer. If we had better knowledge of these factors we might be able to prevent the disease. Epidemiologic studies have provided some leads. We now recognize certain of the factors which may increase a woman's risk of cancer. Advanced age, high socioeconomic status, low parity, late age at first live birth and positive family history all appear to be consistently associated with increased risk. Unfortunately these are not powerful risk factors and most cannot be modified. Several recent studies have suggested that alcohol may increase a woman's risk of breast cancer. Women with other risk factors should be encouraged to limit their alcohol use. Studies of other dietary components, especially fat, have had mixed results that prevent us from making firm recommendations. We obviously need more studies including those which link epidemiology with molecular biology.

It is difficult to speculate about how changes in technology will affect our ability to detect breast cancer in the future. Newer modalities may further lower the size limit for detection, diminish (or eliminate) the radiation hazard,

From Departments of Medicine and Epidemiology, University of North Carolina, Chapel Hill 27514.

and better differentiate benign from malignant disease. Changes in the structure of breast diagnostic clinics may also improve our ability to detect breast cancer in a cost-effective manner. Perhaps hospitals and practitioners will establish "one-stop" facilities where women can take advantage of inexpensive state-of-the-art detection equipment and the means for biopsy sampling of suspicious lesions.

For the present, we need to encourage women to partic-

ipate in breast cancer detection programs. They need to be aware of the importance of the three complementary techniques for early detection — breast self exam, clinical breast exam by a health professional, and mammography. The efforts of the American Cancer Society and the generosity of the editor of the *North Carolina Medical Journal* in providing this forum should be acknowledged and appreciated. ■

To show you how many
hypertensives stayed on

INDERAL[®] LA
(PROPRANOLOL HCl)

after a major nationwide trial...

...we had
to find
just the
right room.

60,073 patients (90%) who started on INDERAL LA stayed on INDERAL LA.^{1*}

Surprising? Not really.

Because most patients on INDERAL LA (propranolol HCl) don't even know it's working.

A recent double-blind, placebo-controlled, crossover study in 138 hypertensive patients² revealed that INDERAL LA has a side effects profile unsurpassed by atenolol or metoprolol — which shows how well-tolerated once-daily INDERAL LA can be.

Sole therapy or concomitant therapy?

Fifty-nine percent of the time, INDERAL LA stood on its own.

The patients in the nationwide compliance trial were no different from yours. Generally when the antihypertensive regimen is complicated, compliance may become a problem. So, the effectiveness of INDERAL LA as once-daily monotherapy is a big plus. Of the remaining hypertensives in the program, 36% were treated merely with the addition of a diuretic to INDERAL LA.

For the noncompliant patients in your practice, INDERAL LA may well be the answer.

Almost 20,000 of the patients in the nationwide compliance trial were identified as having been noncompliant with their previous antihypertensive therapy. Their physicians reported that 88% showed improved compliance when placed on once-daily INDERAL LA.

Control, comfort, and compliance

ONCE-DAILY
INDERAL[®] LA
(PROPRANOLOL HCl) LONG ACTING CAPSULES

Like conventional INDERAL Tablets, INDERAL LA should not be used in the presence of congestive heart failure, sinus bradycardia, cardiogenic shock, heart block greater than first degree, and bronchial asthma.

*After a 30-day trial with INDERAL LA, physicians reported that 90% of the patients would remain on INDERAL LA.

The one you know best keeps looking better

Please see next page for brief summary of prescribing information

NOW AVAILABLE...
NEW LOW DOSE
INDERAL[®] LA 60 mg
(PROPRANOLOL HCl) LONG ACTING CAPSULES

The one you know best keeps looking better

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION SEE PACKAGE CIRCULAR)

INDERAL® LA brand of propranolol hydrochloride (Long Acting Capsules)

DESCRIPTION. INDERAL LA is formulated to provide a sustained release of propranolol hydrochloride. INDERAL LA is available as 60 mg, 80 mg, 120 mg, and 160 mg capsules.

CLINICAL PHARMACOLOGY. INDERAL is a nonselective, beta-adrenergic receptor-blocking agent possessing no other autonomic nervous system activity. It specifically competes with beta-adrenergic receptor-stimulating agents for available receptor sites. When access to beta-receptor sites is blocked by INDERAL, the chronotropic, inotropic, and vasodilator responses to beta-adrenergic stimulation are decreased proportionately.

INDERAL LA Capsules (60, 80, 120, and 160 mg) release propranolol HCl at a controlled and predictable rate. Peak blood levels following dosing with INDERAL LA occur at about 6 hours and the apparent plasma half-life is about 10 hours. When measured at steady state over a 24-hour period the areas under the propranolol plasma concentration-time curve (AUCs) for the capsules are approximately 60% to 65% of the AUCs for a comparable divided daily dose of INDERAL Tablets. The lower AUCs for the capsules are due to greater hepatic metabolism of propranolol resulting from the slower rate of absorption of propranolol. Over a twenty-four (24) hour period, blood levels are fairly constant for about twelve (12) hours then decline exponentially.

INDERAL LA should not be considered a simple mg-for-mg substitute for conventional propranolol and the blood levels achieved do not match (are lower than) those of two to four times daily dosing with the same dose. When changing to INDERAL LA from conventional propranolol, a possible need for retitration upwards should be considered especially to maintain effectiveness at the end of the dosing interval. In most clinical settings, however, such as hypertension or angina where there is little correlation between plasma levels and clinical effect, INDERAL LA has been therapeutically equivalent to the same mg dose of conventional INDERAL as assessed by 24-hour effects on blood pressure and on 24-hour exercise responses of heart rate, systolic pressure and rate pressure product. INDERAL LA can provide effective beta blockade for a 24-hour period.

INDICATIONS AND USAGE. Hypertension: INDERAL LA is indicated in the management of hypertension. It may be used alone or used in combination with other antihypertensive agents, particularly a thiazide diuretic. INDERAL LA is not indicated in the management of hypertensive emergencies.

Angina Pectoris Due to Coronary Atherosclerosis: INDERAL LA is indicated for the long-term management of patients with angina pectoris.

Migraine: INDERAL LA is indicated for the prophylaxis of common migraine headache. The efficacy of propranolol in the treatment of a migraine attack that has started has not been established and propranolol is not indicated for such use.

Hypertrophic Subaortic Stenosis: INDERAL LA is useful in the management of hypertrophic subaortic stenosis, especially for treatment of exertional or other stress-induced angina, palpitations, and syncope. INDERAL LA also improves exercise performance. The effectiveness of propranolol hydrochloride in this disease appears to be due to a reduction of the elevated outflow pressure gradient which is exacerbated by beta-receptor stimulation. Clinical improvement may be temporary.

CONTRAINDICATIONS. INDERAL is contraindicated in 1) cardiogenic shock, 2) sinus bradycardia and greater than first-degree block, 3) bronchial asthma, 4) congestive heart failure (see WARNINGS) unless the failure is secondary to a tachyarrhythmia treatable with INDERAL.

WARNINGS. CARDIAC FAILURE. Sympathetic stimulation may be a vital component supporting circulatory function in patients with congestive heart failure and its inhibition by beta blockade may precipitate more severe failure. Although beta blockers should be avoided in overt congestive heart failure, if necessary, they can be used with close follow-up in patients with a history of failure who are well compensated and are receiving digitalis and diuretics. Beta-adrenergic blocking agents do not abolish the inotropic action of digitalis on heart muscle.

IN PATIENTS WITHOUT A HISTORY OF HEART FAILURE, continued use of beta blockers can, in some cases, lead to cardiac failure. Therefore, at the first sign or symptom of heart failure, the patient should be digitalized and/or treated with diuretics, and the response observed closely or INDERAL should be discontinued (gradually if possible).

IN PATIENTS WITH ANGINA PECTORIS, there have been reports of exacerbation of angina and, in some cases, myocardial infarction, following abrupt discontinuance of INDERAL therapy. Therefore, when discontinuance of INDERAL is planned, the dosage should be gradually reduced over at least a few weeks, and the patient should be cautioned against interruption or cessation of therapy without the physician's advice. If INDERAL therapy is interrupted and exacerbation of angina occurs, it usually is advisable to reinstitute INDERAL therapy and take other measures appropriate for the management of unstable angina pectoris. Since coronary artery disease may be unrecognized, it may be prudent to follow the above advice in patients considered at risk of having occult atherosclerotic heart disease who are given propranolol for other indications.

Nonallergic Bronchospasm (eg, chronic bronchitis, emphysema)—PATIENTS WITH BRONCHOSPASTIC DISEASES SHOULD IN GENERAL NOT RECEIVE BETA BLOCKERS. INDERAL should be administered with caution since it may block bronchodilation produced by endogenous and exogenous catecholamine stimulation of beta receptors.

MAJOR SURGERY. The necessity or desirability of withdrawal of beta-blocking therapy prior to major surgery is controversial. It should be noted, however, that the impaired ability of the heart to respond to reflex adrenergic stimuli may augment the risks of general anesthesia and surgical procedures.

INDERAL (propranolol HCl), like other beta blockers, is a competitive inhibitor of beta-receptor agonists and its effects can be reversed by administration of such agents, eg, dobutamine or isoproterenol. However, such patients may be subject to protracted severe hypotension. Difficulty in starting and maintaining the heartbeat has also been reported with beta blockers.

DIABETES AND HYPOGLYCEMIA. Beta blockers should be used with caution in diabetic patients if a beta-blocking agent is required. Beta blockers may mask tachycardia occurring with hypoglycemia, but other manifestations such as dizziness and sweating may not be significantly affected. Following insulin-induced hypoglycemia, propranolol may cause a delay in the recovery of blood glucose to normal levels.

THYROTOXICOSIS. Beta blockade may mask certain clinical signs of hyperthyroidism. Therefore, abrupt withdrawal of propranolol may be followed by an exacerbation of symptoms of hyperthyroidism, including thyroid storm. Propranolol may change thyroid function tests, increasing T_4 and reverse T_3 and decreasing T_3 .

IN PATIENTS WITH WOLFF-PARKINSON-WHITE SYNDROME, several cases have been reported in which, after propranolol, the tachycardia was replaced by a severe bradycardia requiring a demand pacemaker. In one case, this resulted after an initial dose of 5 mg propranolol.

PRECAUTIONS. GENERAL. Propranolol should be used with caution in patients with impaired hepatic or renal function. INDERAL (propranolol HCl) is not indicated for the treatment of hypertensive emergencies.

Beta-adrenergic receptor blockade can cause reduction of intraocular pressure. Patients should

be told that INDERAL may interfere with the glaucoma screening test. Withdrawal may lead to a return of increased intraocular pressure.

CLINICAL LABORATORY TESTS. Elevated blood urea levels in patients with severe heart disease, elevated serum transaminase, alkaline phosphatase, lactate dehydrogenase.

DRUG INTERACTIONS. Patients receiving catecholamine-depleting drugs such as reserpine should be closely observed if INDERAL is administered. The added catecholamine-blocking action may produce an excessive reduction of resting sympathetic nervous activity which may result in hypotension, marked bradycardia, vertigo, syncope, attacks, or orthostatic hypotension.

Caution should be exercised when patients receiving a beta blocker are administered a calcium-channel-blocking drug, especially intravenous verapamil, for both agents may depress myocardial contractility or atrioventricular conduction. On rare occasions, the concomitant intravenous use of a beta blocker and verapamil has resulted in serious adverse reactions, especially in patients with severe cardiomyopathy, congestive heart failure or recent myocardial infarction.

Aluminum hydroxide gel greatly reduces intestinal absorption of propranolol.

Ethanol slows the rate of absorption of propranolol.

Phenytoin, phenobarbital, and rilampin accelerate propranolol clearance.

Chlorpromazine, when used concomitantly with propranolol, results in increased plasma levels of both drugs.

Antipyrene and lidocaine have reduced clearance when used concomitantly with propranolol.

Thyroxine may result in a lower than expected T_3 concentration when used concomitantly with propranolol.

Cimetidine decreases the hepatic metabolism of propranolol, delaying elimination and increasing blood levels.

Theophylline clearance is reduced when used concomitantly with propranolol.

CARCINOGENESIS, MUTAGENESIS, IMPAIRMENT OF FERTILITY. Long-term studies in animals have been conducted to evaluate toxic effects and carcinogenic potential. In 18-month studies in both rats and mice, employing doses up to 150 mg/kg/day, there was no evidence of significant drug-induced toxicity. There were no drug-related tumorigenic effects at any of the dosage levels. Reproductive studies in animals did not show any impairment of fertility that was attributable to the drug.

PREGNANCY. Pregnancy Category C. INDERAL has been shown to be embryotoxic in animal studies at doses about 10 times greater than the maximum recommended human dose.

There are no adequate and well-controlled studies in pregnant women. INDERAL should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

NURSING MOTHERS. INDERAL is excreted in human milk. Caution should be exercised when INDERAL (propranolol HCl) is administered to a nursing woman.

PEDIATRIC USE. Safety and effectiveness in children have not been established.

ADVERSE REACTIONS. Most adverse effects have been mild and transient and have rarely required the withdrawal of therapy.

Cardiovascular. Bradycardia, congestive heart failure, intensification of AV block, hypotension, paresthesia of hands, thrombocytopenic purpura, arterial insufficiency, usually of the Raynaud type.

Central Nervous System. Light-headedness, mental depression manifested by insomnia, lassitude, weakness, fatigue, reversible mental depression progressing to cataplexy, visual disturbances, hallucinations, vivid dreams, an acute reversible syndrome characterized by disorientation for time and place, short-term memory loss, emotional lability, slightly clouded sensorium, and decreased performance on neuropsychometrics. For immediate formulations, fatigue, lethargy and vivid dreams appear dose related.

Gastrointestinal. Nausea, vomiting, epigastric distress, abdominal cramping, diarrhea, constipation, mesenteric arterial thrombosis, ischemic colitis.

Allergic. Pharyngitis and agranulocytosis, erythematous rash, fever combined with aching and sore throat, laryngospasm and respiratory distress.

Respiratory. Bronchospasm.

Hematologic. Agranulocytosis, nonthrombocytopenic purpura, thrombocytopenic purpura.

Auto-Immune. In extremely rare instances, systemic lupus erythematosus has been reported.

Miscellaneous. Alopecia, LE-like reactions, psoriasis-like rashes, dry eyes, male impotence, and Peyronie's disease have been reported rarely. Oculomucocutaneous reactions involving the skin, serous membranes and conjunctivae reported for a beta blocker (propranolol) have not been associated with propranolol.

DOSEAGE AND ADMINISTRATION. INDERAL LA provides propranolol hydrochloride in a sustained-release capsule for administration once daily. If patients are switched from INDERAL Tablets to INDERAL LA Capsules, care should be taken to assure that the desired therapeutic effect is maintained. INDERAL LA should not be considered a simple mg-for-mg substitute for INDERAL. INDERAL LA has different kinetics and produces lower blood levels. Retitration may be necessary, especially to maintain effectiveness at the end of the 24-hour dosing interval.

HYPERTENSION.—Dosage must be individualized. The usual initial dosage is 80 mg INDERAL LA once daily, whether used alone or added to a diuretic. The dosage may be increased to 120 mg once daily or higher until adequate blood-pressure control is achieved. The usual maintenance dosage is 120 to 160 mg once daily. In some instances a dosage of 640 mg may be required. The time needed for full hypertensive response to a given dosage is variable and may range from a few days to several weeks.

ANGINA PECTORIS.—Dosage must be individualized. Starting with 80 mg INDERAL LA once daily, dosage should be gradually increased at three- to seven-day intervals until optimal response is obtained. Although individual patients may respond at any dosage level, the average optimal dosage appears to be 160 mg once daily. In angina pectoris, the value and safety of dosage exceeding 320 mg per day have not been established.

If treatment is to be discontinued, reduce dosage gradually over a period of a few weeks (see WARNINGS).

MIGRAINE.—Dosage must be individualized. The initial oral dose is 80 mg INDERAL LA once daily. The usual effective dose range is 160-240 mg once daily. The dosage may be increased gradually to achieve optimal migraine prophylaxis. If a satisfactory response is not obtained within four to six weeks after reaching the maximal dose, INDERAL LA therapy should be discontinued. It may be advisable to withdraw the drug gradually over a period of several weeks.

HYPERTROPHIC SUBAORTIC STENOSIS.—80-160 mg INDERAL LA once daily.
PEDIATRIC DOSAGE.—At this time the data on the use of the drug in this age group are too limited to permit adequate directions for use.

For professionals, a major disability or illness can be financial disaster.

A disability income protection plan from Connecticut Mutual replaces earnings lost because of disability.

Our plan includes:

- high benefit limits that replace more of your income;
- special reduced rates for non-smokers;
- proportionate benefits when you can only work part-time but still

need a full-time income;

—the ability to increase your basic policy benefit as your income increases, regardless of your health;

—reimbursement for vocational and educational expenses during rehabilitation;

—an "Own Occupation" rider that pays full benefits if you are unable to perform the main duties of your own occupation, even if you earn income from a different job or business;

—we can also pay dividends that

reduce the cost of your coverage.

Call today to find out how we can custom design a Blue Chip protection plan to keep your income healthy.

The Hinrichs Financial Group

1600 Charlotte Plaza
Charlotte, NC 28244

Screening in Everyday Practice

Remembering to do CBE and finding the time to perform it can be difficult in a busy office practice. Prompting, using manual flow sheets or computerized reminders, can help physicians remember to perform CBE at regular intervals.¹⁷ Trained nurses may also do the examinations.

Screening may seem unrewarding because so many examinations must be done to find even one cancer. Based upon U.S. incidence data, overall only about one in every 1,100 women examined would have breast cancer.¹⁸ However, the ratio changes dramatically as the age of the woman (and consequently her risk for breast cancer) increases, falling from about one in 83,000 for women 20 to 24, to one in 540 for women 50 to 54, and to one in 313 for women 70 to 74 (table 2). Thus, it is particularly important to emphasize screening among older women and those with a personal or family history of breast cancer, for these are the women most at risk for breast cancer. ■

A Positive Point About Breast Cancer.

Now we can see it before you can feel it. When it's no bigger than the dot on this page.

And when it's 90% curable. With the best chance of saving the breast.

The trick is catching it early. And that's exactly what a mammogram can do.

A mammogram is a simple x-ray that's simply the best news yet for detecting breast cancer. And saving lives.

If you're over 35, ask your doctor about mammography.

Give yourself the
chance of a lifetime.™

* ROCEPHIN is indicated in the following infections: bacterial septicemia, bone and joint, intra-abdominal, lower respiratory tract, skin and skin structure, urinary tract, bacterial meningitis and gonorrhea. Please see summary of product information on adjacent page for indicated susceptible organisms.

The BCDDP was not designed to collect mortality data. It did demonstrate the ability of mammography to diagnose minimal and invasive cancers which were non-palpable (35%) in women under the age of 50. The BCDDP also found a higher percentage of minimal and small cancers, which should be an indication of the improvement in mammographic technique between the 1960s and the 1970s.

Current Use of Mammography

The American Cancer Society and the National Cancer Institute, two major organizations concerned with cancer prevention in the United States, have somewhat different mammographic guidelines for asymptomatic women. For women 50 and over, both groups recommend annual or routine screening, combining both mammography and physical examination. The recommendations of the National Cancer Institute for younger women restrict mammographic screening to those at high risk. On the other hand, the American Cancer Society recommends a baseline mammogram for all asymptomatic women age 35 to 40 and screening every one to two years for asymptomatic women age 40 to 49. The American College of Radiology makes recommendations similar to those of the American Cancer Society. Mammography should generally not be performed in women under age 30.

If the National Cancer Institute or American Cancer Society guidelines had been adopted by the medical and lay communities, one would expect routine use of mammography in the 50-and-older age category. Data indicate, however, that only 15-20% of American women age 50 and over have had a mammogram and that a much smaller percentage are being examined regularly. There is a direct correlation between mammogram usage and patient demographic factors such as education, income, and urban versus suburban residence. Increased use is associated with increased knowledge of breast cancer detection and treatment procedures.

Among physicians, there seems to be a wide discrepancy between belief in the importance of mammography and utilization of this procedure. Although 41% of physicians surveyed by the American Cancer Society in 1984 "agreed completely" with the guidelines for screening, only 11% said they observed the guidelines. Gynecologists were more committed to mammography than were internists and general practitioners.

Deterrents to the Use of Mammography

Factors cited by physicians as deterrents to recommending routine mammography screening included radiation risks, unnecessary biopsies, financial considerations, confusion regarding age for screening, and doubts about the relative value of mammography.

Over the last ten years, with continued technological improvements in equipment and film, not only has the ability to detect breast cancers increased, but the average mid-breast dose of radiation has decreased considerably. In the 1960s, the mean skin dosage was 7.7 rads. Now, in most instances, the average surface exposure is 0.47 rads for film screen units and 1.2 rads for xeromammography. The significant comparison exposure is computed for mid-breast dose, which is 0.035 rads for film and 0.36 rads for xeromammography. The American Cancer Society has concluded that "modern technology has reduced the radiation exposure of low-dose mammography to the point of negligible risk, if risk exists at all, and has increased its diagnostic capabilities at the same time."

Screening mammography is advocated to detect breast cancer at an earlier stage than it would be detected by clinical examination alone. Mammography also helps in

Interpretation of the Mammogram Report

Findings on mammographic accuracy vary between 85% and 94% — unfortunately not perfect. Dense breast tissue, whether in a young glandular breast or a dystrophic breast, limits the mammographic detection rate. Clinicians must continue to interpret a "negative" mammogram report in the context of their clinical findings. Consulting the radiologist, possibly adding mass-specific views or ultrasound, may help the primary care physician or surgeon in making the decision to biopsy or not to biopsy.

the interpretation of palpable findings. Most medical centers which are reporting biopsy results have an average of one in four positive lesions. Some extremely aggressive programs have reported as few as one in 13 positive biopsies. In North Carolina, most of the screening programs find that their detection rates fall between one in four and one in six positive cases per recommended biopsy. One must consider that taking advantage of the early detection ability of mammography entails some unnecessary biopsies, but this must also be compared with the number of unnecessary biopsies that are performed on clinical evaluation alone. To make an impact on screening, one must be somewhat aggressive in biopsy recommendation.

Until recently, the economics of mammography have been a major deterrent to physicians in recommending routine screening to any but their highest-risk patients. At present, several insurance companies cover the cost of mammography only for symptomatic women, and mammography is not authorized by Medicare for routine screening purposes. The American College of Radiology and the American Cancer Society have urged radiologists nationally to lower mammographic costs to encourage better utilization. The last two

years have seen a great reduction in the cost of mammography in North Carolina. Many areas charge less than \$60 and some even as little as \$29. Decreasing cost is possible with large volume screening.

The campaign of the American Cancer Society to increase breast cancer detection awareness is directed not only to the public, but also to physicians. Doctors' attitudes and practices will need to change considerably regarding routine mammographic screening if there is to be a significant decrease in mortality from breast cancer over the next several decades. The prospects for change should be excellent based on technical advances, cost reduction, and risk reduction. The breast is beautiful. Making it an object of critical medical attention may save many lives. ■

THE FUTURE IS NOW WITH THE ELIMINATOR

"Eliminator" is a fairly harsh word to describe an x-ray generator. However, the Compu-mAs system from Bennett X-Ray Corp. and B & B X-Ray does so many things for you, there's no other word to explain it. The generator automatically calculates the next available mAs from the 34 time stations and the 7 mA stations, therefore eliminating many of the steps that were once necessary in taking x-rays.

The Compu-mAs:

- Eliminates setting major and minor kVp tap switches
- Eliminates setting high and low range for kV selectors
- Eliminates calculating mA \times time to find mAs
- Eliminates checking and adjusting line compensation
- Eliminates the need to set both mA and time

By eliminating all of these steps, the Eliminator moves into the future without sacrificing dependability and accuracy. Dependability has been a benefit of owning a Bennett Radiographic System for over 30 years. And now, by automatically selecting the next available mAs combination of mA and time, Compu-mAs provides accuracy to almost infinite resolution. The Compu-mAs Eliminator—just another way B & B X-Ray is working for your end result, optimum quality radiographs.

Specify Adjunctive

LIBRAX

Each capsule contains 5 mg chlordiazepoxide HCl and 2.5 mg clidinium bromide

Please consult complete prescribing information, a summary of which follows:

* **Indications:** Based on a review of this drug by the National Academy of Sciences—National Research Council and/or other information, FDA has classified the indications as follows:
"Possibly" effective: as adjunctive therapy in the treatment of peptic ulcer and in the treatment of the irritable bowel syndrome (irritable colon, spastic colon, mucous colitis) and acute enterocolitis. Final classification of the less-than-effective indications requires further investigation.

Contraindications: Glaucoma; prostatic hypertrophy, benign bladder neck obstruction; hypersensitivity to chlordiazepoxide HCl and/or clidinium Br.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants, and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Physical and psychological dependence rarely reported on recommended doses, but use caution in administering Librium® (chlordiazepoxide HCl/ Roche) to known addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions) reported following discontinuation of the drug.

Usage in Pregnancy: Use of minor tranquilizers during first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy. Advise patients to discuss therapy if they intend to or do become pregnant.

As with all anticholinergics, inhibition of lactation may occur. **Precautions:** In elderly and debilitated, limit dosage to smallest effective amount to preclude ataxia, oversedation, confusion (no more than 2 capsules/day initially; increase gradually as needed and tolerated). Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider pharmacology of agents, particularly potentiating drugs such as MAO inhibitors, phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions reported in psychiatric patients. Employ usual precautions in treating anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship not established.

Adverse Reactions: No side effects or manifestations not seen with either compound alone reported with Librax. When chlordiazepoxide HCl is used alone, drowsiness, ataxia, confusion may occur, especially in elderly and debilitated; avoidable in most cases by proper dosage adjustment, but also occasionally observed at lower dosage ranges. Syncope reported in a few instances. Also encountered: isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent, generally controlled with dosage reduction; changes in EEG patterns may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice, hepatic dysfunction reported occasionally with chlordiazepoxide HCl, making periodic blood counts and liver function tests advisable during protracted therapy. Adverse effects reported with Librax typical of anticholinergic agents, i.e., dryness of mouth, blurring of vision, urinary hesitancy, constipation. Constipation has occurred most often when Librax therapy is combined with other spasmolytics and/or low residue diets.

When brain and bowel conflict...

It's time for the Peacemaker.

In irritable bowel syndrome*, anxiety can aggravate intestinal symptoms, which may further intensify anxiety — a distressing cycle of brain/bowel conflict. Librax intervenes with two well-known compounds. The Librium® (chlordiazepoxide HCl/Roche) component safely relieves anxiety. And Quarzan® (clidinium bromide/Roche) provides antisecretory and antispasmodic action to relieve discomfort associated with intestinal hypermotility.

Dual action — for peace between brain and bowel. Because of possible CNS effects, caution patients about engaging in activities requiring complete mental alertness. Specify Adjunctive

LIBRAX®

Each capsule contains 5 mg chlordiazepoxide HCl
and 2.5 mg clidinium bromide

*Librax has been evaluated as possibly effective as adjunctive therapy in the treatment of peptic ulcer and the irritable bowel syndrome.

Not Just A Name Without A Face

For over 70 years, Saint Albans Hospital has offered the highest quality of psychiatric care.

At the center of this care are the fine physicians on the Active Medical Staff of Saint Albans Hospital. Their concern is reflected in the treatment given each and every patient. Through specialized programs for adolescents, senior adults, those with chemical dependencies and those with eating disorders, our physicians work to restore their patients to full recovery.

When you have a patient in need of psychiatric help, call one of our doctors, knowing your patient will receive the best care possible.

P.O. Box 3608 Radford, Virginia 24143

Virginia's only private, full-service, not-for-profit psychiatric hospital.

How More Than 3000 Doctors Have Eased The Pain Of Managing A Practice.

If your practice is like a lot of others, you often spend more time on office problems than on the health problems of your patients.

Our one easy-to-use, fully-integrated computer system can take care of billing, provide financial updates, help you market your practice. And give you more time to do what you went to medical school for.

"We've found that Medic saves us many hours of paperwork every week."

Ellen Dudley, office manager, Quadrangle Internal Medicine, Greenville, North Carolina

With Medic, jobs that once took a large part of the business day can be done in minutes. And that's only one of the ways that Medic makes the medical office run more smoothly.

"Our practice has doubled and we have not had to add additional billing personnel. Medic has been able to handle whatever we've asked of it."

Nancy Psimas, office coordinator, Portsmouth Orthopaedic Associates, Portsmouth, Virginia

The Medic system can ease the process of sending statements and reduce the number of uncollected bills. Plus, our easy-to-understand printouts help you keep

better track of your financial condition.

"Any time we've had a problem, Medic has been immediately responsive. They bend over backwards to suit their customers. It's the best money we have ever spent."

Wynne Vaughan, office manager, Capital Pediatric and Adolescent Center, P.A., Raleigh, North Carolina

We'll do whatever it takes to keep your system working. Day or night. We have a toll-free STAT line to handle questions and problems. And there's a STAT PLUS line from our support center to your system for software updates and diagnoses.

"Their software is extremely easy and user-friendly."

Patricia Parker, administrator, Bradford Clinic, P.A., Charlotte, North Carolina

Not only do we make program changes for individual medical practices, we also provide our customers with software enhancements, which often result from customer suggestions. For individual medical practices, we also provide our customers with software enhancements, which often result from customer suggestions. We'll make sure Medic can do what you need it to do.

"Medic's extensive training program for our staff made it easy to introduce the system. We recommend it highly."

Tessa Horne, administrator, Morgantown Ear, Nose & Throat Clinic, Morgantown, West Virginia

"We love the training program. And the updates they do really help," Ms. Horne said. When a practice brings in over 200 patients a day as this one does, the business office has to run smoothly. "Medic does everything we need. It's great."

So if you want to increase the efficiency, productivity and profitability of your practice, take a look at the Medic Computer System.

Over 3000 physicians in more than 800 practices throughout the U.S. are calling it a minor medical miracle.

Patients Are Now Looking Better Than Ever.

Magnetic Resonance Imaging is the most advanced diagnostic technology of the last 25 years. The quality of MRI images is helping physicians make easier, more accurate diagnoses.

Now, Craven County Hospital, in cooperation with Lenoir Memorial Hospital and Onslow Memorial Hospital, is bringing this technology to more physicians in Eastern North Carolina through MRI Ltd. The MRI unit is housed in a large van and will travel between New Bern,

Kinston, and Jacksonville.

From these sites, it will serve physicians and patients of Craven County, Lenoir Memorial, Onslow Memorial, Beaufort

County, Carteret General, Pitt Memorial, and Wayne Memorial Hospitals.

For more information or to refer patients, call Craven County Hospital at 919-633-8218 or toll free 1-800-682-0276.

do not use

Burroughs Wellcome Co.
3030 Cornwallis Road
Research Triangle Park, NC 27709

Copyright © 1987 Burroughs Wellcome Co. All rights reserved. NI-092
Please see following page for brief summary of prescribing information.

NIX FOR LICE[®]

CREME RINSE

permethrin 1%

PELICULICIDAL/OVICIDAL ACTIVITIES: *In vitro* data indicate that permethrin has pediculicidal and ovicidal activity against *Pediculus humanus* var. *capitis*. The high cure rate (97.99%) of Nix in patients with head lice demonstrated at 14 days following a single application is attributable to a combination of its pediculicidal and ovicidal activities and its residual persistence on the hair which may also prevent reinfestation.

INDICATIONS AND USAGE: Nix is indicated for the single-application treatment of infestation with *Pediculus humanus* var. *capitis* (the head louse) and its nits (eggs). Retreatment for recurrences is required in less than 1% of patients since the ovicidal activity may be supplemented by residual persistence in the hair. If live lice are observed after at least seven days following the initial application, a second application can be given.

CONTRAINDICATIONS: Nix is contraindicated in patients with known hypersensitivity to any of its components, to any synthetic pyrethroid or pyrethrin, or to chrysanthemums.

WARNING: If hypersensitivity to Nix occurs, discontinue use.

PRECAUTIONS:

General: Head lice infestation is often accompanied by pruritus, erythema, and edema. Treatment with Nix may temporarily exacerbate these conditions.

Information for Patients: Patients with head lice should be advised that itching, redness, or swelling of the scalp may occur after application of Nix. If irritation persists, they should consult their physician. Nix is not irritating to the eyes; however, patients should be advised to avoid contact with eyes during application and to flush with water immediately if Nix gets in the eyes. In order to prevent accidental ingestion by children, the remaining contents of Nix should be discarded after use.

Combing of nits following treatment with Nix is not necessary for effective treatment. However, patients may do so for cosmetic or other reasons. The nits are easily combed from the hair treated with Nix after drying.

Carcinogenesis, Mutagenesis, Impairment of Fertility: Six carcinogenicity bioassays were evaluated with permethrin, three each in rats and mice. No tumorigenicity was seen in the rat studies. However, species-specific increases in pulmonary adenomas, a common benign tumor of mice of high spontaneous background incidence, were seen in the three mouse studies. In one of these studies there was an increased incidence of pulmonary alveolar-cell carcinomas and benign liver adenomas only in female mice when permethrin was given in their food at a concentration of 5000 ppm. Mutagenicity assays, which give useful correlative data for interpreting results from carcinogenicity bioassays in rodents, were negative. Permethrin showed no evidence of mutagenic potential in a battery of *in vitro* and *in vivo* genetic toxicity studies.

Permethrin did not have any adverse effect on reproductive function at a dose of 180 mg/kg/day orally in a three-generation rat study.

Pregnancy: Teratogenic Effects: Pregnancy Category B: Reproduction studies have been performed in mice, rats, and rabbits (200-400 mg/kg/day orally) and have revealed no evidence of impaired fertility or harm to the fetus due to permethrin. There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Nursing Mothers: It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk and because of the evidence for tumorigenic potential of permethrin in animal studies, consideration should be given to discontinuing nursing temporarily or withholding the drug while the mother is nursing.

Pediatric Use: Nix is safe and effective in children two years of age and older. Safety and effectiveness in children less than two years of age have not been established.

ADVERSE REACTIONS: The most frequent adverse reaction to Nix is pruritus. This is usually a consequence of head lice infestation itself, but may be temporarily aggravated following treatment with Nix. 5.9% of patients in clinical studies experienced mild temporary itching; 3.4% experienced mild transient burning/stinging, tingling, numbness, or scalp discomfort; and 2.1% experienced mild transient erythema, edema, or rash of the scalp.

DOSAGE AND ADMINISTRATION:

Adults and Children: Nix is intended for use after the hair has been washed with shampoo, rinsed with water and towel dried. Apply a sufficient volume of Nix to saturate the hair and scalp. Nix should remain on the hair for 10 minutes before being rinsed off with water. A single treatment is sufficient to eliminate head lice infestation. Combing of nits is not required for therapeutic efficacy, but may be done for cosmetic or other reasons.

SHAKE WELL BEFORE USING.

HOW SUPPLIED: Nix (Permethrin) 1% (wt./wt.) Creme Rinse is supplied in plastic squeeze bottles that contain 2 fl. oz. weighing 56 g. (NDC-0081-0780-81)

Store at 15°-25°C (59°-77°F).

Ceclor[®]
cefactor

250-mg Pulvules[®] t.i.d.
offers effectiveness against
the major causes of bacterial bronchitis

Haemophilus influenzae, Streptococcus pneumoniae
(ampicillin-susceptible and ampicillin-resistant)

Note: Ceclor is contraindicated in patients with known allergy to the cephalosporins and should be given cautiously to penicillin-allergic patients.

Penicillin is the usual drug of choice in the treatment and prevention of streptococcal infections, including the prophylaxis of rheumatic fever. See prescribing information.

Ceclor[®] (cefactor)

Summary. Consult the package literature for prescribing information.

Indications: Lower respiratory infections, including pneumonia, caused by susceptible strains of *Streptococcus pneumoniae*, *Haemophilus influenzae*, and *Streptococcus pyogenes* (group A β -hemolytic streptococci).

Contraindication:

Known allergy to cephalosporins.

Warnings:

CECLOR SHOULD BE ADMINISTERED CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. PENICILLINS AND CEPHALOSPORINS SHOW PARTIAL CROSS-ALLERGENICITY. POSSIBLE REACTIONS INCLUDE ANAPHYLAXIS.

Administer cautiously to allergic patients. Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics. It must be considered in differential diagnosis of antibiotic-associated diarrhea. Colon flora is altered by broad-spectrum antibiotic treatment, possibly resulting in antibiotic-associated colitis.

Precautions:

- Discontinue Ceclor in the event of allergic reactions to it.
- Prolonged use may result in overgrowth of nonsusceptible organisms.
- Positive direct Coombs' tests have been reported during treatment with cephalosporins.
- Ceclor should be administered with caution in the presence of markedly impaired renal function. Although dosage adjustments in moderate to severe renal impairment are usually not required, careful clinical observation and laboratory studies should be made.
- Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.
- Safety and effectiveness have not been determined in pregnancy, lactation, and infants less than one month old. Ceclor penetrates mother's milk. Exercise caution in prescribing for these patients.

Adverse Reactions: (percentage of patients)

Therapy-related adverse reactions are uncommon. Those reported include:

- Gastrointestinal (mostly diarrhea): 2.5%.
- Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment.
- Hypersensitivity reactions (including morbilliform eruptions, pruritus, urticaria, and serum-sickness-like reactions that have included erythema multiforme [rarely, Stevens-Johnson syndrome] or the above skin manifestations accompanied by arthritis/arthritis-like, frequently, fever): 1.5%; usually subside within a few days after cessation of therapy. Serum-sickness-like reactions have been reported more frequently in children than in adults and have usually occurred during or following a second course of therapy with Ceclor. No serious sequelae have been reported. Antihistamines and corticosteroids appear to enhance resolution of the syndrome.
- Cases of anaphylaxis have been reported, half of which have occurred in patients with a history of penicillin allergy.
- As with some penicillins and some other cephalosporins, transient hepatitis and cholestatic jaundice have been reported rarely.
- Rarely, reversible hyperactivity, nervousness,

insomnia, confusion, hypertonia, dizziness, and somnolence have been reported.

- Other: eosinophilia, 2%; genital pruritus or vaginitis, less than 1%; and, rarely, thrombocytopenia.

Abnormalities in laboratory results of uncertain etiology

- Slight elevations in hepatic enzymes.
- Transient fluctuations in leukocyte count (especially in infants and children).
- Abnormal urinalysis: elevations in BUN or serum creatinine.
- Positive direct Coombs' test.
- False-positive tests for urinary glucose with Benedict's or Fehling's solution and Clinistest[®] tablets but not with Tes-Tape[®] (glucose enzymatic test strip, Lilly).

Breast Cancer

Early Detection May Mean Cure

MARGARET L. BERTRAND, M.D.

Breast cancer is the number-one female cancer, now striking nearly one out of every ten American women. Despite advances in surgery and chemotherapy, the death rate has changed little over the last forty years.

Because there is no known prevention of breast cancer, emphasis must be placed on detecting it early. At this stage, breast cancer is highly treatable and in many instances is associated with normal life expectancy. The earlier breast cancer is discovered, the more options a woman has about surgery. Depending on size and location of the tumor, removal of the breast (mastectomy) may not be necessary. Lesser surgery combined with radiation therapy may be recommended instead.

Defense against breast cancer involves a three-part program which each woman should maintain throughout her life: breast self-examination, routine physician breast physical, and mammography (breast x-ray).

Breast Self-Examination

Breast self-examination should become a habit practiced once a month. Women need to check themselves when

they are least likely to be engorged; for menstruating women, one week after their period begins, and for women on replacement hormone therapy, the first day of their estrogen medication. The exam should include inspection in front of a mirror and palpation lying down and sitting or standing. Detailed information on this procedure is available free from the American Cancer Society (see the paper on breast self-examination in this section of the *Journal*).

There is evidence that the more experienced a woman is in self-examination, the smaller the tumor she is capable of feeling. Women 20 years of age and older should perform breast self-examination every month.

Physical Examination

Women age 20 to 40 should have a physical examination of the breasts every three years, and women over 40 should have a physical examination of the breasts every year. This can often be combined with a gynecological exam or regular check-up.

Mammography

Mammography is an x-ray of the breast which is capable of detecting many breast cancers two to three years earlier than they can be felt by patients or physicians.

Director of Bertrand Diagnostic Imaging & Breast Center, Inc.; Associate Professor of Radiology, Duke University Medical Center, Durham 27710.

The size of a breast cancer at discovery, and whether or not nearby lymph nodes are involved, are two of the main determinants of survival. When diagnosed at 5 mm (the size of a pea), the five-year survival rate is 98% and the 20-year survival rate is 93%. Most breast cancers (75%) are found by the woman herself, with an average size of 2-3 cm (the size of a pecan). At this stage, approximately half of the cancers have already spread to lymph nodes. Even without lymph node spread, the 20-year survival rate is only 62%, but once lymph nodes are involved, the 20-year survival rate is less than 25%.

Mammography is the most sensitive of the tests available in detecting breast cancer, with an 85-90% detection rate. Not only is mammography safe and accurate, but it is a proven life-saver based on three major studies. Two of these, one carried out in New York City in the 1960s and the other more recently in Sweden, reported 30-40% fewer deaths among women over 50 who had

routine breast x-rays along with their annual physical exams. A third study, organized jointly by the National Cancer Institute and the American Cancer Society, demonstrated that 35.4% of breast cancers detected in women under 50 were found by mammography alone; and in areas where follow-up data are available, all of the women in this study whose breast cancers had been identified on mammography were alive five years after diagnosis. Because of these encouraging results, the American College of Radiology and the American Cancer Society have issued a set of recommendations for the routine use of mammography.

It is important for all women to be aware of their personal risk factors for developing breast cancer. Until medical science develops a method of prevention, success in early detection of breast cancer is based on an aggressive three-part program of breast self-examination, physician breast exam, and x-ray mammography. ■

WHO IS AT RISK FOR BREAST CANCER?

- All women are at risk. Only 1% of breast cancers occur in men. Seventy-five percent of women who get breast cancer have no risk factors other than being female.
- The risk increases with age. Two-thirds of breast cancers occur over age 50, but, sadly, 12% of breast cancer occurs under age 40.
- A personal history of breast cancer increases the risk for a second breast cancer to one in six.
- Family history is a strong risk factor if mother or sister has had a breast cancer before menopause. The risk is exceedingly high if these relatives have had breast cancer in both breasts. Of much less risk is a close relative having a breast cancer after menopause. Only if there are several relatives with breast cancer on the father's side of the family is that considered a significant risk.
- Other risk factors include never having had children, having had a first baby after age 35, early menarche, and late menopause.

WHO SHOULD HAVE A MAMMOGRAM?

As currently recommended by the American College of Radiology and the American Cancer Society for asymptomatic women:

- Age 40-49, a mammogram every one to two years
- Age 50 and over, a mammogram every year

Because each woman's breast x-ray is different in its appearance, unique only to her (like a fingerprint), many physicians urge their patients to have their first mammogram between age 35 and 39 to establish their baseline normal. All future studies (when the risk for breast cancer is higher) will be compared to this baseline.

Women at high risk should consult their personal physician because it may be necessary to begin screening at a younger age.

Today only 5-15% of women in the recommended age category for screening are getting their routine mammography. If your physician has not already recommended this test, ask about it soon.

HOW IS MAMMOGRAPHY PERFORMED?

The standard mammographic procedure is two x-ray views of each breast, one from the side and one from above.

To increase accuracy of detection, and to decrease radiation dose, adequate compression is necessary. This may be slightly uncomfortable, but usually is not painful if performed at the same time of the cycle that breast self-examination is suggested.

IS MAMMOGRAPHY SAFE?

Only a few years ago, doctors were fiercely debating whether this breast x-ray might cause breast cancer. Fortunately, now that these x-rays deliver one-tenth the radiation of former techniques, the controversy has been laid to rest. Mammography is now thought to pose virtually no increased risk for developing breast cancer.

In choosing where you will have this x-ray examination, a few important questions should be asked:

- Is the equipment specifically designed for mammography?
- How much radiation is used in each x-ray? (If the answer is more than 1 rad, you might consider consulting another clinic.)
- Is the mammogram read by a *radiologist* certified by the American Board of Radiology, and is the radiologist experienced in interpreting mammograms?

WHERE IS MAMMOGRAPHY PERFORMED AND HOW MUCH DOES IT COST?

In North Carolina, there are several free-standing breast centers, most of them associated with outpatient radiology centers. Additionally, mammography is performed in most hospitals.

In this state, most mammography is priced at less than \$100, and in some areas may be as low as \$29. Often, routine mammography (performed in patients without symptoms) may not be covered by insurance and is not covered by Medicare.

Breast Self Examination

Early Detection For Breast Cancer

ANNIE HAYES, R.N., M.P.H.

The good news is that breast cancer can be cured, if it is detected and treated early. If you are a woman, do you do breast self exam (BSE) monthly? If you do, congratulations! You are among the 27% of American women who are doing BSE regularly, once a month.

The best weapon against breast cancer is early detection. By doing BSE, women detect 95% of cancers of the breast. But let me reassure you that most breast lumps are not cancer. After investigation, only two out of 10 breast lumps turn out to be cancer.

Today breast cancer is discussed openly. Women are putting aside their fears about breast cancer and asking questions in order to know as much as they possibly can about how to protect themselves.

What are the facts?

Breast cancer is the number one killer among women age 35 to 54. About one out of every 10 women will develop breast cancer sometime during her lifetime. An estimated 130,000 new cases will have been diagnosed in the United States in 1987 and 41,000 women are expected to die of breast cancer.

What are the warning signals?

Breast changes that *persist*, such as a lump, thickening, distortion, retraction, or scaliness of the nipple, nipple discharge, pain or tenderness, are all causes for concern and should be checked out by your doctor.

Public Health Nursing Consultant, North Carolina Department of Human Resources, Division of Health Services, Adult Health Services Section, Raleigh 27602-2091.

Remember, *most* breast conditions are *not* cancer, but only a physician can make a diagnosis.

What are the risk factors?

Age is the single most important risk factor. Breast cancer rarely occurs in women under age 35. Women at higher risk are over age 50; have personal or family history of breast cancer; have never given birth; or have their first child after age 30.

According to Dr. Susan Love, Director of the Breast Clinic at Beth Israel Hospital in Boston, 70-80% of women diagnosed with breast cancer have *no* risk factors. Therefore, all women should consider themselves at risk and incorporate this into their daily self-care program.

What can you do about early detection?

The American Cancer Society recommends the monthly practice of BSE by women 20 years and older as a routine good health habit. The Cancer Society also recommends a baseline mammogram for women age 35 to 39. Women 40 to 49 without symptoms should have mammography every one to two years, and those age 50 and over should have yearly mammograms.

In addition, a professional physical examination of the breasts is recommended at least every three years for women 20 to 40 and every year for those over 40.

A combination of mammography, breast self exam and regular breast examinations by a health professional could reduce the number of cancer deaths by 50%.

Examining Your Breasts

A woman's breasts have a special significance for her; breasts represent femininity, womanhood, mothering and sexuality. Most women do not practice breast self exam each month because of fear and not knowing what they are feeling. It is difficult to tell the difference between normal and abnormal without training and practice. The important thing is to learn how *your* breasts feel and detect any changes over time. Training by a health care professional can help relieve your fears and increase your confidence in performing BSE.

Here are the steps of BSE. Illustrations are from the American Cancer Society's booklet "How To Examine Your Breasts."¹

1 In the shower:

Examine your breasts during bath or shower; hands glide more easily over wet skin. Fingers flat, move gently over every part of each breast. Use the right hand to examine the left breast, the left hand for the right breast. Check for any lump, hard knot or thickening.

2 Before a mirror:

Inspect your breasts with arms at your sides. Next, raise your arms high overhead. Look for any changes in contour of each breast: a swelling, dimpling of skin or changes in the nipple.

Then rest palms on hips and press down firmly to flex your chest muscles. Left and right breast will not match exactly; few women's breasts do. Regular inspection shows what is normal for you and will give you confidence in your examination.

3 Lying down:

To examine your right breast, put a pillow or folded towel under your right shoulder. Place your right hand behind your head; this distributes breast tissue more evenly on the chest.

With your left hand, fingers flat, press gently in small circular motions around an imaginary clock face. Begin at outermost top of your right breast for 12 o'clock, then move to 1 o'clock, and so on around the circle back to 12. A ridge of firm tissue in the lower curve of each breast is normal. Then move in an inch, toward the nipple.

Keep circling to examine every part of your breast, including the nipple. This requires at least three more circles. Now slowly repeat the procedure on your left breast with a pillow under your left shoulder and your left hand behind your head. Notice how your breast structure feels.

Finally, squeeze the nipple of each breast gently between your thumb and index finger. Any discharge, clear or bloody, should be reported to your doctor immediately.

BSE is every woman's first line of defense against breast cancer. Ask your health care professional to do a thorough breast examination demonstrating how to do BSE. Call on your local American Cancer Society if you would like more information or training on how to do BSE.¹⁻⁴

What else can you do to protect yourself against cancer? Practice a healthy lifestyle; eat a variety of foods from the basic food groups; exercise; avoid obesity, cigarettes, and alcohol. Strive for a balance between work and play. Learn how to relax and enjoy life. ■

“YES, THERE IS LIFE AFTER BREAST CANCER. AND THAT’S THE WHOLE POINT.”

—Ann Jillian

A lot of women are so afraid of breast cancer they don't want to hear about it.

And that's what frightens me.

Because those women won't practice breast self-examination regularly.

Those women, particularly those over 35, won't ask their doctor about a mammogram.

Yet that's what's required for breast cancer to be detected early. When the cure rate is 90%. And when there's a good chance it won't involve the loss of a breast.

But no matter what it involves, take it from someone who's been through it all.

Life is just too wonderful to give up on. And, as I found out, you don't have to give up on any of it. Not work, not play, not even romance.

Oh, there is one thing, though.

You do have to give up being afraid to take care of yourself.

AMERICAN CANCER SOCIETY®

Get a checkup. Life is worth it.

PHYSICIANS, SCHEDULE SOME TIME FOR YOUR COUNTRY.

Many physicians would like to devote some time to their country in a local Army Reserve unit. We know that making a weekend commitment can be difficult for most physicians. So it is practical for the Army Reserve units to be flexible about time. It's worth discussing.

Incidentally, in addition to satisfying your own desire to serve your country, there are exceptional opportunities to do something totally different from a day-to-day routine. Opportunities to study new areas of medicine, meet new people in your specialty, and be a part of one of the world's most advanced medical teams.

Discuss the opportunities with our Army Medical Personnel Counselor.

FOR SURGEONS LOOKING FOR A CHALLENGE.

Your challenge could be the Army Reserve unit near you. It's a unit that requires the services of surgeons.

You may wish to explore the challenge of teaching in a major medical center. You may wish to explore the special challenges of your specialty in triage. Certainly you'll be confronted by challenges very different from your daily routine.

You'll also have an opportunity to participate in a number of programs in which you'll be able to exchange views and information with other surgeons from all over the country.

The Army Reserve understands the time demands on a busy physician, so you can count on us to be totally flexible in making time for you to share your specialty with your country. We'll arrange your training program to work with your practice.

To find out about the benefits of serving with a nearby Army Reserve unit, we recommend you call our Army Medical Personnel Counselor.

PHYSICIANS, THERE ARE TWO KINDS OF FLEXIBILITY IN THE ARMY RESERVE WE THINK YOU'LL LIKE.

One, time. We know how tough it is for a busy physician to make weekend time commitments. So we offer flexible training programs that allow a physician to share some time with his or her country. We arrange a schedule to suit your requirements.

Two, the opportunity to explore other phases of medicine, to add a different kind of knowledge—the challenge of military health care. It's a flexibility which could prove to be both stimulating and rewarding, with the opportunity to participate in a variety of programs that can put you in contact with medical leaders from all over the country.

See how flexible we can be, call our Army Medical Personnel Counselor.

**ARMY RESERVE.
BE ALL YOU CAN BE.**

HERE'S ONE DOCTOR WHO WON'T PAY HIS MALPRACTICE PREMIUMS THIS YEAR.

The Army covers his premiums. Since he's an Army Physician, there are a lot of worries associated with private practice that he won't have to contend with. Like excessive paperwork, and the overhead costs incurred in running a private practice.

What he will get is a highly challenging, highly rewarding experience. The Army offers varied assignments, chances to specialize, or further your education, and to work with a team of dedicated health care professionals. Plus a generous benefits package.

If you're interested in practicing high quality health care with a minimum of administrative burdens, examine Army medicine. Talk to your local Army Medical Department Counselor for more information.

to smiling again!

The rewards of Limbitrol

in moderate depression and anxiety:

- Rapid results—62% of total four-week improvement within a week versus 44% with amitriptyline¹
- Earlier relief of associated somatic complaints²
- Fewer dropouts due to side effects—only 1/3 the rate of those patients taking amitriptyline, although the incidence of side effects is comparable¹
- Fast improvement with less amitriptyline—1/3 to 1/2 the dose of patients taking amitriptyline alone³

Caution patients about the combined effects of Limbitrol with alcohol or other CNS depressants and about activities requiring complete mental alertness, such as operating machinery or driving a car. In general, limit dosage to the lowest effective amount in elderly patients.

SEE THE DIFFERENCE IN THE FIRST WEEK¹

Limbitrol[®]

Limbitrol[®]

Tranquilizer—Antidepressant

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Relief of moderate to severe depression associated with moderate to severe anxiety

Contraindications: Known hypersensitivity to benzodiazepines or tricyclic antidepressants. Do not use with monoamine oxidase (MAO) inhibitors or within 14 days following discontinuation of MAO inhibitors since hyperpyretic crises, severe convulsions and deaths have occurred with concomitant use; then initiate cautiously, gradually increasing dosage until optimal response is achieved. Contraindicated during acute recovery phase following myocardial infarction

Warnings: Use with great care in patients with history of urinary retention or angle-closure glaucoma. Severe constipation may occur in patients taking tricyclic antidepressants and anticholinergic-type drugs. Closely supervise cardiovascular patients. (Arrhythmias, sinus tachycardia and prolongation of conduction time reported with use of tricyclic antidepressants, especially high doses. Myocardial infarction and stroke reported with use of this class of drugs.) Caution patients about possible combined effects with alcohol and other CNS depressants and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving).

Usage in Pregnancy: Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Since physical and psychological dependence to chlordiazepoxide have been reported rarely, use caution in administering Limbitrol to addiction-prone individuals or those who might increase dosage, withdrawal symptoms following discontinuation of either component alone have been reported (nausea, headache and malaise for amitriptyline; symptoms [including convulsions] similar to those of barbiturate withdrawal for chlordiazepoxide).

Precautions: Use with caution in patients with a history of seizures, in hyperthyroid patients or those on thyroid medication, and in patients with impaired renal or hepatic function. Because of the possibility of suicide in depressed patients, do not permit easy access to large quantities in these patients. Periodic liver function tests and blood counts are recommended during prolonged treatment. Amitriptyline component may block action of guanethidine or similar antihypertensives. When tricyclic antidepressants are used concomitantly with cimetidine (Tagamet), clinically significant effects have been reported involving delayed elimination and increasing steady state concentrations of the tricyclic drugs. Concomitant use of Limbitrol with other psychotropic drugs has not been evaluated; sedative effects may be additive. Discontinue several days before surgery. Limit concomitant administration of ECT to essential treatment. See Warnings for precautions about pregnancy. Limbitrol should not be taken during the nursing period. Not recommended in children under 12. In the elderly and debilitated, limit to smallest effective dosage to preclude ataxia, oversedation, confusion or anticholinergic effects.

Adverse Reactions: Most frequently reported are those associated with either component alone: drowsiness, dry mouth, constipation, blurred vision, dizziness and bloating. Less frequently occurring reactions include vivid dreams, impotence, tremor, confusion and nasal congestion. Many depressive symptoms including anorexia, fatigue, weakness, restlessness and lethargy have been reported as side effects of both Limbitrol and amitriptyline. Granulocytopenia, jaundice and hepatic dysfunction have been observed rarely.

The following list includes adverse reactions not reported with Limbitrol but requiring consideration because they have been reported with one or both components or closely related drugs: Cardiovascular: Hypotension, hypertension, tachycardia, palpitations, myocardial infarction, arrhythmias, heart block, stroke.

Psychiatric: Euphoria, apprehension, poor concentration, delusions, hallucinations, hypomania and increased or decreased libido.

Neurologic: Incoordination, ataxia, numbness, tingling and paresthesias of the extremities, extrapyramidal symptoms, syncope, changes in EEG patterns.

Anticholinergic: Disturbance of accommodation, paralytic ileus, urinary retention, dilatation of urinary tract.

Allergic: Skin rash, urticaria, photosensitization, edema of face and tongue, pruritus.

Hematologic: Bone marrow depression including agranulocytosis, eosinophilia, purpura, thrombocytopenia.

Gastrointestinal: Nausea, epigastric distress, vomiting, anorexia, stomatitis, peculiar taste, diarrhea, block tongue.

Endocrine: Testicular swelling and gynecomastia in the male, breast enlargement, galactorrhea and minor menstrual irregularities in the female, elevation and lowering of blood sugar levels, and syndrome of inappropriate ADH (antidiuretic hormone) secretion.

Other: Headache, weight gain or loss, increased perspiration, urinary frequency, mydriasis, jaundice, alopecia, parotid swelling.

Overdosage: Immediately hospitalize patient suspected of having taken an overdose. Treatment is symptomatic and supportive. IV administration of 1 to 3 mg physostigmine salicylate has been reported to reverse the symptoms of amitriptyline poisoning. See complete product information for manifestation and treatment.

Dosage: Individualize according to symptom severity and patient response. Reduce to smallest effective dosage when satisfactory response is obtained. Larger portion of daily dose may be taken at bedtime.

Single h.s. dose may suffice for some patients. Lower dosages are recommended for the elderly. Limbitrol DS (double strength) Tablets, initial dosage of three or four tablets daily in divided doses, increased up to six tablets or decreased to two tablets daily as required. Limbitrol Tablets, initial dosage of three or four tablets daily in divided doses, for patients who do not tolerate higher doses.

How Supplied: Double strength (DS) Tablets, white, film-coated, each containing 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt), and Tablets, blue, film-coated, each containing 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt). Available in bottles of 100 and 500; Tel-E-Dose[®] packages of 100, Prescription Paks of 50.

The Diagnosis and Current Surgical Management of Breast Cancer

James F. Newsome, M.D.

In distilling the plethora of articles on breast cancer over the last several decades, one finds a recurring theme: the smaller the tumor at diagnosis, the longer the survival. Critical reappraisals of past experience and the results of randomized, clinical trials have altered our concepts to the extent that the management of patients suspected or proven to have breast cancer in the mid-1980s has little resemblance to the previous, almost Pavlovian, response of "breast cancer ergo mastectomy," radical or otherwise.

There are many factors contributing to these changes, among them mammography, the diagnosis of lesions based upon cytologic diagnosis of fine needle aspirates, the demonstration that appropriately administered radiation is equivalent to surgery in the local control of breast cancer in selected patients, the utility of axillary dissection as a staging as well as a therapeutic procedure, adjuvant chemotherapy, steroid hormone receptors, patient participation in therapy decisions, the evolution of the "two-step" procedures for diagnosis and treatment, breast reconstruction, and a recognition that our ability to accurately stage breast cancer continues to be limited. An in-depth discussion of each of the above is neither planned nor necessary. Since the overall management of patients with breast cancer and the appropriate sequential use of surgery, radiation therapy, and chemotherapy is governed by an appreciation for and the results of these factors, most will require some mention.

At the outset, it may be useful to point out some recent encouraging trends. Letton and Mason¹ observed no cancer-related deaths at ten and a half years following treatment of mammographically detected breast cancers in 62 postmenopausal women. Treatment included tylectomy (removal of the local lesion) and radiation therapy, total mastectomy and axillary node dissection, and in some the classical radical mastectomy. Blot et al² reported an approximately 15% decline in breast cancer mortality among premenopausal American women, presumably the result of earlier detection and the use of adjuvant chemotherapy. Our data (figure 1) indicate a complete reversal of the ratio of local to regional spread; currently in excess of 65% of the

patients are classed as Stage I or less at the time of diagnosis. While the hope is that these trends are real and that by detecting minimal and in-situ lesions in increasing numbers of patients we can begin to significantly alter the mortality curves, previous experience leads us to be cautiously optimistic.

Mammography

Of the above-mentioned factors, *mammography* has had the greatest impact. Since the disclosure of the improved survival among women involved in the Health Insurance Plan of New York (HIP) study in the late 1960s and early 1970s, and the positive effect of early diagnosis of breast cancer by the Breast Cancer Detection Demonstration Project (BCDDP) in the late 1970s, there has been a continuing, striking improvement in the quality of the mammographic films, a decrease in the radiation exposure, and a greater availability of radiologists skilled in mammographic interpretation. There persists, however, a false negative rate of 5-10% in the best of circumstances; probably as great as 20% in areas without ideal facilities. This observation makes it unwise to rely upon mammography to ascertain the nature of a palpable breast mass. Nevertheless, skilled mammog-

Figure 1. Observed changes in the stage at the time of diagnosis of breast cancer since 1968.

From the Department of Surgery, University of North Carolina School of Medicine, Chapel Hill 27514.

raphy has proven to be the gold standard in screening for minimal and subclinical breast cancer.

The role of mammography in therapy planning has not been generally emphasized. The radiographic demonstration of a spiculated mass, two cm or less in size, without other worrisome changes, suggests that therapy with breast preservation is an acceptable option. The demonstration, however, of multiple foci of clustered microcalcifications scattered throughout a goodly portion of a breast quadrant, or other lesions with worrisome radiographic characteristics, would indicate that the hope of controlling such a cancer without total mastectomy is unrealistic.

As indicated, the ideal use of mammography is as a screening device for the identification of subclinical disease. In the presence of a palpable mass, mammograms are procured *not* to determine the nature of the mass but to evaluate the remaining portions of this breast as well as the opposite breast for evidence of subclinical cancer. Palpable masses are best evaluated by fine needle aspiration.

Fine Needle Aspiration

The use of *cytologic study of a fine needle aspirate* to confirm one's suspicion of malignancy in the breast seems well-established. That it can adequately confirm one's suspicion of benignancy is not so clearly demonstrated, though its acceptance seems to be increasing. The cumulative experience of a number of studies evaluating the sensitivity and specificity of cytologic diagnosis of fine needle aspirates of thyroid, breast, lymph node, and prostate samples indicates an accuracy rate of about 90%.

The most frequent use of fine needle aspiration is to ascertain whether a palpable mass is cystic or solid, a judgment that is not reliably made by physical examination alone; viewed differently, the procedure is used to determine the need for an open biopsy. The recovery of watery, cloudy fluid that varies in color from amber to greenish-black with *complete disappearance* of the mass is characteristic of a benign cyst and cytologic study of the aspirate is rarely indicated. Failure to achieve complete disappearance of the mass, or the recovery of material not in keeping with a benign cyst, requires cytologic study of the aspirated debris and/or biopsy in most, if not all, instances.

The technical considerations in the procurement and preparation of material for cytologic study may vary a great deal; the methods employed should be determined in consultation with the cytopathologist who has a responsibility for interpretation.

Steroid Hormone Receptors

Knowledge of *steroid hormone receptor* levels is useful in planning treatment for recurrent or metastatic disease and, in some instances, in planning adjuvant therapy. The insta-

bility and heat lability of the steroid hormone receptor complex is such that fresh tissue, promptly frozen, is a basic requirement for accurate assessment of receptor concentration using the dextran charcoal coated method. The increasing availability of immunologic techniques for the determination of steroid receptor levels from fine needle aspirates should make such information routinely available on all patients with breast cancer.

Adjuvant Chemotherapy

Breast cancer *adjuvant chemotherapy* was the subject of a Consensus Development Conference of the National Institutes of Health in September 1985. While optimal therapy has not been identified, based on experience to date the following conclusions were reached:

- 1 For premenopausal women with positive lymph nodes, regardless of hormonal receptor status, treatment with established combination chemotherapy should become standard care.
- 2 For premenopausal patients with negative nodes, adjuvant chemotherapy is not generally recommended. For certain high-risk patients in this group, adjuvant chemotherapy should be considered.
- 3 For postmenopausal patients with positive nodes and positive hormone receptor levels, Tamoxifen is the treatment of choice.
- 4 For postmenopausal patients with positive nodes and negative hormone receptor status, chemotherapy may be considered but cannot be recommended as standard practice.
- 5 For postmenopausal women with negative nodes, regardless of hormonal receptor status, there is no indication for routine adjuvant treatment. For certain high-risk patients in this group, adjuvant therapy may be considered.

In addition to the above recommendations, all would agree that clinical investigation continues to be an important part of the adjuvant chemotherapy program and that physicians should strongly encourage all their patients with breast cancer to consider participation in controlled clinical trials.

Radiation Therapy

Several studies have shown that local control of breast cancer in selected patients can be achieved as well by *radiation therapy* after excision of the primary tumor as by mastectomy. In 1985, Fisher et al³ reported the experiences of the National Surgical Adjuvant Program for Breast Cancer (NSAPB), demonstrating no advantage in ultimate survival when total mastectomy was compared with segmental mastectomy (i.e., tylectomy, "lumpectomy," wide local excision) followed by radiation therapy. There was an im-

provement in local control in those individuals receiving radiation therapy. Patients included in the study had lesions that measured up to 4 cm in diameter. Since size of the primary tumor has been shown to be one of the more reliable predictors of subsequent outcome, it is the feeling of many (this author included) that these data, which appear competitive with other reports at five years, will eventually prove again the prognostic value of tumor size.

It has been a universal experience that approximately 80% of breast cancers are of the infiltrating ductal and lobular varieties. There are, however, other histologic varieties that do not demonstrate nodal metastasis with the frequency of the more common tumors, and survival rates at 10 years are generally 30% to 40% better. These include colloid, papillary, medullary, and tubular carcinomas. This histologic information is very relevant in considering treatment recommendations that include breast preservation.

Preoperative Evaluation

What constitutes an adequate *preoperative evaluation* for metastatic disease? There are no studies to indicate that, in the absence of symptoms, the currently available imaging techniques are uniformly useful in a search for metastatic disease. Quite the contrary, all studies have shown that, in a truly asymptomatic patient, bone and liver scans are an expense and a use of resources that cannot be justified. It has been a practice, however, to procure a bone scan prior to planning therapy for individuals in whom the physical examination implies disease that is far more extensive than the history would suggest. A chest x-ray is still considered an important part of the preoperative evaluation for breast cancer patients, though the discovery of metastatic disease in the absence of symptoms is quite low. It is apparent that current techniques do not adequately demonstrate asymptomatic microscopic systemic disease. The use of monoclonal antibody techniques for this purpose holds considerable promise that staging can indeed be accurately achieved.

From the above it should be evident that there is no standard form of management applicable to all patients with breast cancer. It is only after cell type and extent of disease are known that a firm recommendation for management can be formulated, including alternative treatment methods. In this regard it is our custom to discuss with the patient and the family the need to procure as much information as possible prior to recommendations for therapy. This permits some understanding of the steps necessary in outlining treatment programs and at the same time allows patient participation in such therapy decisions. It is extremely important, we believe, for the radiation oncologist to have an opportunity to evaluate and discuss alternative forms of management with the patient *prior* to any therapeutic maneuver being undertaken.

Translating the above into diagnostic and treatment strategies, the following may be illustrative.

Individuals found to have radiographically suspicious areas on routine screening mammography require biopsy, usually after needle localization, of the specimen being radiographed to ensure that the area of concern has been excised. In most instances the specimen, if it proves to be carcinoma, is of such small size that traditional methods of steroid hormone receptor level determination are not applicable. Individuals in whom the remaining portion of the breast shows no suspicious radiographic change are currently thought to be ideal candidates for radiation therapy, thus preserving the breast. In those who are candidates for adjuvant chemotherapy, a limited axillary dissection is recommended. The finding of carcinoma in any lymph node is indicative of the need for adjuvant therapy.

Patients who present with palpable breast lumps undergo the same plan of management. The presence of carcinoma can usually be established by cytopathologic study of the cellular debris recovered by fine needle aspiration of the palpable mass. If physical and radiographic examination indicate that breast preservation therapy is a realistic option, a judgment in which the patient should participate, procedures similar to those just outlined are followed. In most instances wide excision of the palpable mass for determination of cell type, steroid hormone receptor activity, and an assessment by the pathologist of the involvement of the margins are all useful in planning subsequent management.

Should there be indications of other disease within the breast or if the size of the lesion exceeds 3 cm, or if after excisional biopsy the cosmetic result is likely to be unacceptable, then, we believe, total mastectomy and a full axillary dissection, usually referred to as a "modified radical mastectomy," is the procedure of choice. Our practice is to procure immediately prior to mastectomy, if we have not already done so, an adequate fresh sample of the tumor for steroid hormone receptor level determination.

If, for any of several reasons, preservation of the breast is not a treatment option, there seems little reason not to proceed with total mastectomy and axillary node dissection.

Axillary Node Dissection

Emphasis on *axillary node dissection* as an indicator of the extent of disease, and the concern that arm edema may be increased when radiation is added to a dissected axilla, have led to the concept of limited axillary dissection. All patients with breast cancer, whether treated by tylectomy and radiation or by mastectomy, should undergo axillary dissection, unless it is clear that systemic adjuvant therapy will not be indicated. Physical examination is unreliable in ascertaining the presence or absence of nodal metastasis.

The levels of axillary dissection are defined as follows: Level I is marked by the lateral border of the pectoralis minor muscle; Level II reaches to the medial border of the pectoralis minor muscle; and Level III is that portion of the axilla from the medial border of the pectoralis minor to the

apex of the axilla, defined at the point that the subclavian vein disappears into the chest over the first rib. Individuals undergoing total mastectomy and axillary node dissection (modified radical mastectomy) are generally subjected to a complete axillary dissection, that is, including Level III. In the majority, this can be accomplished with preservation of the pectoralis minor, but care must be exercised to preserve the nerve supply to the pectoral muscles.

Axillary dissection to Level II is the most common practice when tylectomy and radiation therapy are planned. It is customary to indicate the extent of the dissection by a radiopaque clip to aid the radiation therapist in planning therapy. Level I or lesser dissections are reserved for those situations in which the simple documentation of suspected axillary nodal metastases is the goal.

Total mastectomy and axillary node dissection is by far the most common surgical procedure for the local control of breast cancer employed in this country today. In some instances if the pectoralis muscle appears involved, the standard radical mastectomy is employed for local control of disease.

Breast Reconstruction

Breast reconstruction is a valuable asset in the management of women with breast cancer. Whether immediate or, as in most instances, delayed three to six months after mastectomy, breast reconstruction offers these women good balance and symmetry. It contributes to good body image and enables patients to wear their usual wardrobe without the insecurity of an external removable breast prosthesis.

Contralateral Breast Biopsy

Although this procedure was carried out routinely for about 15 years, we no longer perform contralateral breast biopsy except in individuals who have physical and radiographic areas of suspicion or if the primary carcinoma in the ipsilateral breast is of a lobular cell type. In this instance, a 2 x 2 x 3 cm biopsy specimen from the upper outer quadrant is procured for histologic study.

Prophylactic Mastectomy

The role of *prophylactic mastectomy* has been variously discussed as a procedure for the prevention of cancer. The indications are not totally clear. Nulliparous women with a prominent family history of breast cancer in premenopausal first degree relatives and with atypical hyperplasia on biopsy are likely candidates. If such is deemed necessary, efforts to achieve complete removal of all breast tissue are imperative. This generally requires a total mastectomy including the nipple and areola complex and, if so desired, breast reconstruction.

Conclusions

The appropriate treatment for breast cancer is governed by size and location of lesion, age of patient, histologic cell type, extent of disease (including multicentricity), nodal involvement, metastatic deposits, the steroid hormone concentration, and the patient's understanding of the significance of the results of these procedures and the logic behind the therapeutic recommendation. If attempts at local control of the breast cancer without removal of the breast seem at all reasonable, consultation with the radiation therapist should be sought prior to any recommendations for the institution of treatment.

Returning to the initial theme, there is now considerable evidence that the expanding use of screening mammography to detect subclinical cancer is the single most important factor governing the recommendations for therapy for breast cancer. It carries with it the opportunity to further decrease the mortality rate that has now, for the first time, become evident. ■

The Current Role of Radiation in the Management of Breast Cancer

Carolyn Ferree, M.D.

The Halstedian principle of radical surgery for breast cancer endured nearly 75 years before McWhirter challenged the tradition by introducing the concept of lesser surgery followed by radiation. Although management of breast cancer has become increasingly conservative in recent years, no clear biological principle has directed this trend. In fact, the earliest experience with lumpectomy followed by radiation resulted when some women refused mastectomy; hence in many respects these women pioneered the conservative approach to the treatment of early breast cancer, which remains controversial despite its increasing popularity.

As of 1985, 42 studies had been conducted in 12 countries including the United States, and more than 10,000 patients had been treated by this conservative approach.¹ In no study has the survival rate for this method been any less favorable than for patients who undergo mastectomy. Follow-up in some of these studies is as long as 30 years,² and three of the studies were prospectively randomized. Despite all the data accumulated during the past 50 years, only 11%³ of the 120,000 women who develop breast cancer each year are treated conservatively. Yet the majority of patients are suitable candidates for conservative management, and the numbers should continue to rise as screening mammography, which allows earlier detection of cancer, becomes a regular component of the physical examination.

Although conservative therapy was pioneered without directed principles, biological principles which support the approach have been recognized during the past 15 years. The supporting principle is based on the recognition that aggressive local therapy has not improved survival rates because breast cancer is most frequently a systemic disease. Hence, it follows that control of local disease should not significantly alter survivals. Another factor supporting acceptance of lesser surgery for breast cancer is the recognition of the psychological aspects of losing a breast to cancer.

What is Conservative Management?

Conservative management of breast cancer is the surgical removal of the primary lesion with negative margins and axillary dissection for staging followed by radiation therapy. The role of the radiation is to eradicate any microscopic tumor cells within the breast. With this approach, permanent local control can be achieved, histological and biochemical information can be ascertained, and the breast can be preserved with good cosmesis. Another important positive aspect of this approach is that it provides additional incentive for women to participate in early detection programs.

There are several negative aspects concerning therapy. The radiation treatments are time-consuming, usually requiring between five and seven weeks. The radiation is expensive if one considers interruption of work and commuting expenses. Furthermore, persistent lymphocytopenia often follows the radiation, and the patient and physician must commit to a frequent and long-term follow-up program. Lastly, 70% of patients who undergo lumpectomy and radiation therapy are treated unnecessarily, since the local failure rate is approximately 30% for those treated by margin-negative lumpectomy alone. Unfortunately, at this time there are no clear-cut criteria for selecting those most likely to have recurrences.

Absolute contraindications to this mode of treatment are few. The finding of multiple lesions is a contraindication, and lobular carcinoma, infiltrating or in situ, is probably best treated by mastectomy because of the risk of multicentricity. Intraductal carcinoma is *not* a contraindication unless it is an extensive component of an infiltrating lesion as well as adjacent tissue. In this case, the local recurrence rate can be as high as 25%.⁴ Except for intralymphatic extension in the index tumor, the National Surgical Adjuvant Breast Project (NSABP) B-06 study revealed no pathological contraindications.⁵ A very large pendulous breast can be technically difficult to treat and, because of loss of skin-sparing in the folds around the breast, moist desquamation or ulceration can be a problem. Consequently, most patients with very large breasts are probably best treated by mastectomy, although reconstruction is difficult unless it is accompanied by contralateral reduction mammoplasty. Tu-

mor-breast ratio is also an important factor in the candidate selection process. Tumor size itself is probably not a contraindication as long as the tumor does not involve skin or chest wall; however, if the tumor is large and the breast is small, so that the ratio approaches one, the cosmetic result will be poor. In those cases mastectomy and reconstruction are usually recommended. Also there are a few patients who psychologically are not prepared to accept the 7-10% possibility of local recurrence, which would then require a mastectomy.

A team approach between surgeon and radiotherapist is of extreme importance if the best cosmesis is to be obtained. Recommendations have been published by the NSABP for the segmental mastectomy and the axillary dissection which will optimize cosmesis. The greatest pitfall is the use of a single diagonal incision to remove an upper outer-quadrant lesion and then extending into the axilla for the axillary dissection. The eventual result is contraction of the breast toward the axilla, as well as a scar which can become very uncomfortable from the friction produced by a conventional bra. A second pitfall is the closure of dead space following the segmental mastectomy, which results in a significant and unnecessary concave defect within the breast tissue.

Radiation technique is also a major factor in cosmesis, although it cannot improve upon the end result of the segmental mastectomy. Supervoltage equipment is essential to preserve skin-sparing. For the same reason, bolus (tissue density material added to skin to increase skin dose, but sacrifice skin-sparing) is avoided. A treatment-planning computed tomographic (CT) scan through the central portion of the breast is obtained and used to generate isodose distributions to ensure homogeneity of dose throughout the breast. This procedure is done for each patient and frequently requires wedge beam modifiers. The breast is treated with opposed tangential portals angled to minimize divergence of beams into the lung.

Cosmetic Results

Cosmesis is the primary advantage of segmental mastectomy and radiation, and with appropriate orchestration between surgeon and radiation oncologist, approximately 80% of patients have good to excellent cosmetic results. The majority of patients develop a transient edema of the breast which is directly related to the extent of the axillary dissection,⁶ and many have persistent mild edema for two to three years. Patients with large breasts are more likely to develop breast fibrosis and retraction secondary to the radiation, whereas patients with small breasts have more visible surgical defects, depending on the surgical technique and amount of breast tissue removed. Adjuvant chemotherapy apparently has some detrimental impact on cosmesis. According to Beadle,⁷ 24% of patients who received chemotherapy had an excellent cosmetic result, compared to 64% of those who did not receive chemotherapy; how-

Table 1

Complications of Primary Radiotherapy: Stage I and II Breast Cancer

Complication	Danoff ¹⁰	BGSM ¹¹	Chu ¹²
Arm edema	1-9%	3%	5%
Rib fracture	1-4%	<1%	
Pneumonitis	2-4%	2%	3%
Fat necrosis		1%	
Myositis	5%	1%	
Skin ulceration	1-2%	2%	2%
Severe breast fibrosis	2-6%	<1%	3%

ever, the results were still considered good. Danoff⁸ reported good or excellent cosmesis in 81% of those treated with chemotherapy, compared to 89% treated with primary radiation alone.

Two to three years is probably adequate time to assess the definitive cosmetic⁹ result in patients who receive radiation alone; however, for those receiving adjuvant chemotherapy more time may be required to reach a cosmetic endpoint.

Complications

Complications are seen in approximately 5% of patients treated with segmental mastectomy and radiation. A summary of the most common complications appears in table 1. With adjuvant chemotherapy, the single complication with an increased incidence is arm edema (22% versus 1-5%).⁸

There have been no reports of second malignancies following conservative treatment despite series dating from the 1930s. Neither has there been any evidence that the incidence of contralateral breast cancer is increased.

Other Roles of Radiation Therapy

Radiation therapy should continue to play a role after mastectomy in those patients who are at high risk for local-regional recurrence. In the Radiation Therapy Department at Bowman Gray School of Medicine, 27-36% of the recent patients with breast cancer (excluding those receiving pal-

liative therapy for distant metastatic disease) had received adjuvant chemotherapy for their high-risk status, but the cancer had recurred either during their chemotherapy or shortly after completion of chemotherapy. Prior to the advent of adjuvant chemotherapy, when radiation was employed more routinely, local recurrences were seen less frequently (table 2). After overt recurrence, the local control rates are only 28-49%.^{13,14}

Despite radiation, 7-10% of these high-risk patients will have recurrences. Local-regional recurrence can be a dreadful complication for the patient, psychologically and physically, and should be prevented if at all possible. High-risk factors include positive deep margins at time of mastectomy, skin involvement, multiple positive nodes, extensive involvement of the breast, large primary, nodal extracapsular extension, or inflammatory breast cancer following appropriate chemotherapy and mastectomy.

Palliative management of metastatic breast cancer is important for patients with bone pain, cord compression, brain metastasis, or many other symptom-producing situations. Quality of survival can be improved in approximately 75-80% of these patients.

Present State of the Art

The benefits of segmental mastectomy and radiation as conservative management of early breast cancer should no longer be questioned, although some specifics about the combined procedure remain controversial. Multiple studies in the literature supporting the use of segmental mastectomy and radiation report survival rates at least equal to those obtained with mastectomy. It is important to realize, however, that most patients treated thus far have been selected for small lesions and uncomplicated pathology.

Although 7-10% of these patients may have a local recurrence, there is no evidence that survivals are adversely affected if there is adherence to appropriate follow-up guidelines and if proper treatment is undertaken at the time of recurrence. These results contrast sharply with those of patients with chest wall recurrences following mastectomy with only 20-40% alive at five years.

Local-regional recurrences have become a major concern in that adjuvant chemotherapy has not effected the high degree of local control seen in the era of routine postoperative radiation for high-risk patients. If high-risk factors for local recurrence exist, radiation should still be considered as part of the overall management plan. ■

Acknowledgments

My appreciation to Betty J. Metcalf and Donna S. Garrison, Ph.D., for their invaluable assistance in the preparation of this manuscript.

LIBRIUM®

chlordiazepoxide HCl/Roche
5-mg, 10-mg, 25-mg capsules

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Management of anxiety disorders; short-term relief of anxiety symptoms, acute alcohol withdrawal symptoms, preoperative apprehension and anxiety. Usually not required for anxiety or tension associated with stress of everyday life. Efficacy beyond four months not established by systematic clinical studies. Periodic reassessment of therapy recommended.

Contraindications: Known hypersensitivity to the drug.

Warnings: Warn patients that mental and/or physical abilities required for tasks such as driving or operating machinery may be impaired, as may be mental alertness in children, and that concomitant use with alcohol or CNS depressants may have an additive effect. Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage. Withdrawal symptoms (including convulsions) reported after abrupt cessation of extended use of excessive doses are similar to those seen with barbiturates. Milder symptoms reported infrequently when continuous therapy is abruptly ended. Avoid abrupt discontinuation; gradually taper dosage.

Usage in Pregnancy: Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically. Due to isolated reports of exacerbation, use with caution in patients with porphyria.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for maximum beneficial effects. **Oral—Adults:** Mild and moderate anxiety disorders and symptoms, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. **Geriatric patients:** 5 mg b.i.d. to q.i.d. (See Precautions.)

Supplied: Librium® (chlordiazepoxide HCl/Roche) Capsules, 5 mg, 10 mg and 25 mg—bottles of 100 and 500; Tel-E-Dose® packages of 100, available in boxes of 4 reverse-numbered cards of 25, and in boxes containing 10 strips of 10. Libritabs® (chlordiazepoxide/Roche) Tablets, 5 mg and 10 mg—bottles of 100 and 500; 25 mg—bottles of 100. With respect to clinical activity, capsules and tablets are indistinguishable.

The Role of Systemic Therapy in Early Breast Cancer

Stephen A. Bernard, M.D.

Systemic therapy in early breast cancer is based on concepts that evolved during the 1960s. The management of breast cancer until that time was largely surgical and focused on eradication of local disease. The principles of surgical management expounded by Halstead in the late 1800s viewed breast cancer as a localized disease which spread in an orderly fashion to the regional nodes and thence to the remainder of the body.¹

Beginning in the 1950s, observations by Bernard Fisher at the University of Pittsburgh lead him to propose an alternative hypothesis.² Breast cancer is viewed as a disease which may bypass the regional nodes and spread systemically first.² This hypothesis is supported by such observations as circulating cancer cells and the prolonged doubling time of breast cancer.^{2,3} Additionally, several surgical series have demonstrated a distant recurrence rate of 50% or more in women within the first few years after a primary resection.^{3,5}

Most importantly, this alternative hypothesis has been tested in several randomized clinical trials of various surgical techniques which have shown that various forms of aggressive local surgery do not affect the length of disease-free survival (time without recurrence after initial surgery), nor the overall survival (time from initial therapy to death), of the patient. Although these trials have been criticized for their relatively short follow-up, and radiation techniques, the evidence continues to emerge that such surgical techniques as the segmental mastectomy may well be equivalent to the modified radical mastectomy.^{2,4,6}

Because of the high likelihood of distant failure, investigators in the 1960s began focusing on the use of systemic therapy to alter the natural history of early breast cancer.^{2,3,7} Schabel demonstrated in an implantable mouse mammary tumor that the introduction of systemic therapy at an appropriate time and at an appropriate dosage was capable of effecting a cure in 80% of the animals.⁸

Several early clinical trials of adjuvant therapy in the

postoperative period used single-agent chemotherapy in women with breast cancer in an effort to treat occult micrometastases. These trials used as their major criteria for enrollment into the study the presence of axillary nodal involvement in the initial surgical specimen. The presence of regional nodal involvement has been shown to be the most powerful predictor of recurrence.^{2,3,6} The hypothesis proposed by Fisher suggests that these nodes may not be the first site of metastases but serve as an indicator of disease spread outside of the breast.² Several of the original trials also included women without axillary nodal involvement (node negative breast cancer), since even in this group of women recurrence is seen in up to 20-25% after 5-10 years.^{3,6,9}

These trials did not result in the complete elimination of recurrent breast cancer as was hoped. The failure to observe such results initially discouraged physicians interested in this area of clinical investigation. However, beginning with reports by several investigators of a beneficial result for adjuvant chemotherapy in the mid-seventies, additional trials employing combinations of chemotherapy and, in several cases, hormonal manipulation were begun and are still ongoing.¹⁰⁻¹⁴ Thirty-four thousand women have now been enrolled in trials looking at the primary treatment of breast cancer.¹⁵ A few of these trials are summarized in tables 1 and 2 (next page).

Several conclusions can be drawn from these studies:

1. Benefit has been seen mainly as a delay in recurrence of breast cancer (disease-free survival). The studies by Fisher and Bonadonna have shown a delay of recurrence for up to several years.^{11,16} In the trial by Bonadonna, women with more than four nodes involved and presumably the highest tumor burden experienced a delay in recurrence of up to eight years.¹⁶

The impact on survival overall has been less easily shown. The early delay in recurrence has not always translated into prolonged freedom from disease. Treatment at the time of recurrence is relatively successful in breast cancer and may delay further disease progression.³ Only modest attention has been paid to the course of the disease after recurrence in many of these trials. Often women in the postmenopausal

age group may die of other diseases besides breast cancer, diluting the effect of systemic therapy on overall survival.^{16,17}

2. The benefit in either disease-free survival or overall survival has not been seen among all groups of women.

This has been true whether the patients are classified by menopausal status, age, or number of nodes involved.^{6,11-14} Most often, trials with single-agent chemotherapy have shown benefit in women with lesser amounts of disease.¹⁰ On the other hand, trials with combinations of chemotherapy have not always shown benefit to this better prognosis group.¹³

3. The magnitude of the benefit from either chemotherapy or hormonal therapy or a combination is generally in the range of 10-20%; that is, an additional 10-20% of women show a reduction in recurrences in the treated group over the untreated group.^{6,7,10,16} This benefit seems small, but there are 130,000 women who will be newly diagnosed with breast cancer in the United States this year,¹⁸ and if approximately 50% are eligible for adjuvant therapy and an additional 15% would survive because of this treatment, this translates into approximately 10,000 women who would be alive because of such therapy.

4. As has been pointed out by Zelen and Gelman, many of the more recent trials in adjuvant breast cancer therapy have enrolled small numbers of patients for the types of questions being asked, and several of the trials have not been ongoing long enough to draw conclusions from the studies.¹⁷ These recent trial results have again led to

uncertainty in the medical community regarding the value of adjuvant chemotherapy, the groups that should receive this therapy, and what therapy should be given.

Because of the controversies surrounding the role of systemic therapy in the prevention of systemic recurrence in early breast cancer, an NIH Consensus conference was held in September, 1985. The conference concluded that there was enough evidence to warrant the use of chemotherapy in the premenopausal woman with positive nodes.¹⁹ Additionally, there was enough information to warrant the use of hormonal therapy in the postmenopausal woman with involved nodes and positive hormone receptor levels.¹⁹ For other groups, namely, postmenopausal women without positive receptors, and either premenopausal or postmenopausal women without nodal involvement, the previous experience does not support the routine use of adjuvant therapy in a non-investigational setting.¹⁹

A more important message which has not always been emphasized from that consensus meeting is that "all patients and their physicians are strongly encouraged to participate in controlled clinical trials."¹⁹ While physicians decide on the treatment of their patients from information obtained in several ways, the randomized clinical trial provides the most rigorous testing of a new treatment and the hypotheses on which it may be based.^{20,21} While randomized clinical trials are not without problems, these problems have been increasingly recognized and the general quality of clinical trials in breast cancer has improved over the last several years.¹⁵

The impact of the randomized clinical trial on patterns of treatment is harder to assess. In a recent review 16% of all trials in cancer focused on breast cancer as the organ involved.²¹ There is evidence that these trials have influenced the type of surgical procedure being done for breast cancer in the United States.²¹ Medical oncologists have also incorporated the information from these trials into their practices. A recent survey suggests that the practicing medical oncologist is utilizing this information to treat early breast cancer in a more aggressive fashion than the consensus recommendations.²²

Unfortunately, the same survey showed that 49% of the 634 respondents (8,200 hematologists and oncologists were mailed the questionnaire) did not enroll any patients in trials for stage II breast cancer.²² The problem of low enrollment continues to affect the results obtained by randomized clinical trials in early breast cancer. Selection bias, that is, the biasing of results by selection of a study population weighted with either good or poor prognostic indicators, does not allow the results of these trials to be reliably generalized to the larger patient population.

The ability of the clinical trial to generate useful information which is reliable when looked at biologically, clinically, or statistically is to a major extent dependent on sufficient enrollment of patients to achieve as broad a representation of the study population as possible. Only approximately 2% of all women with early breast cancer are enrolled in clinical trials.²³ If further advances are to occur in this area of cancer biology and treatment, these trials must continue and there must be commitment on the part of physicians to these studies. A recent report suggests that patients want such studies to continue.²⁴

Some of the moral, ethical and scientific reasons for this low accrual to clinical trials have been reviewed by Lacher and include problems with informed consent, randomization, and loss of stature by the physician.²⁵ A recent study by Langley et al. suggests that non-oncologic physicians are concerned particularly about the doctor-patient relationship in entering patients on clinical trials.²⁶ It is unclear whether these obstacles to accrual can be overcome to allow answers to the questions being raised by systemic therapy for early breast cancer.

There are other benefits to the use of randomized clinical trials besides answers to the treatment issues being addressed. In particular, the amount of information generated about the natural history of the disease and the realization of the heterogeneous nature of breast cancer, which had previously been viewed as a single disease, have led to a greater sophistication in the development of further studies of treatment in early breast cancer. By asking better questions we will surely obtain more precise answers and continue to improve the treatment of early breast cancer. With increased physician and patient participation, the answers we obtain will be more useful to the general population of women with early-stage breast cancer. ■

Breast Reconstruction Following Mastectomy

Gregory Georgiade, M.D., F.A.C.S.,
Ronald Riefkohl, M.D., F.A.C.S., William Barwick, M.D.,
Nicholas Georgiade, M.D., F.A.C.S.

Carcinoma of the breast represents approximately 20% of all cancers occurring in women, with over 120,000 new cases of breast cancer reported in 1986.

Currently, there are more treatment options available for the patient presenting with primary breast cancer.¹ There has been a notable increase in the number of patients requesting breast reconstruction either immediately following their mastectomy or shortly thereafter.

The patient is now an active participant in the decision regarding the treatment options available. The surgeon should be flexible in selecting the optimal surgical treatment and additional therapeutic regimen for each patient. Treatment options for appropriately selected breast cancer patients include: modified radical mastectomy; modified radical mastectomy with immediate or delayed reconstruction; and segmental mastectomy or lumpectomy with or without axillary dissection and breast irradiation. In selected cases, a radical mastectomy may still be indicated. All of these therapeutic modalities have different benefits and risks.

Indications and Patient Selection for Breast Reconstruction

The patient undergoing breast reconstruction should have a strong desire and motivation for the procedure. General health should be good and, at the time of the reconstruction, there should be no evidence of recurrence. The psychological status should also be stable.

The patient should have realistic goals and expectations as to what will or will not result from breast reconstruction. If the expectations are extremely high, and the patient believes that the reconstructed breast will be an exact duplicate of the breast lost at mastectomy, then the degree of satisfaction will be low.

From Department of Surgery and Division of Plastic, Maxillofacial and Reconstructive Surgery, Duke University Medical Center, Durham 27710.

It is possible currently to achieve satisfactory breast contour and symmetry which allows the patient to wear bathing suits and low-cut necklines without any apparent discrepancy in appearance. One of the major benefits for the active patient is that reconstruction allows participation in such activities as swimming, tennis, golf and aerobic exercise without concern that an external prosthesis will shift. The age of the patient is irrelevant. The authors have reconstructed the breasts of patients between the ages of twenty and seventy years.

Breast reconstruction will be of value for many individuals for both physical and emotional rehabilitation after the extirpative surgery, and will minimize the psychological impact of an altered body image secondary to the extirpative surgery.²⁻⁶

The family physician, general surgeon, and plastic surgeon, in many instances, will function as a team in the overall management of the patient with breast cancer. Either immediate or delayed breast reconstruction in many situations will help the individual patient through a difficult time.

Timing of Reconstruction

In the more than 900 breast reconstructions completed by the authors, the timing of reconstruction has varied depending on a number of factors. In appropriately selected patients with smaller breast cancers and clinically negative axillary nodes, reconstruction can begin at the time of the ablative procedure. In the authors' experience with over 250 patients who have undergone breast reconstruction at the time of a modified radical mastectomy, the overall results have been quite rewarding and decreased the amount of stress the patient experienced after the mastectomy. Observation of this group of patients over a 10-year period yields no evidence that immediate reconstruction has any adverse effect on the patient's ultimate survival, or on local or regional recurrence rate of primary breast cancer.⁷⁻⁹

Figure 1A. A preoperative view of a 48-year-old patient with an infiltrating ductal carcinoma.

If reconstruction is not initiated at the time of the original mastectomy, then the allowed time lapse is usually four to six months before beginning reconstruction. This allows for complete wound healing and resolution of the inflammatory response from the mastectomy. If the patient received chemotherapy, then the reconstruction is delayed until at least several months have elapsed following completion of the chemotherapy (or radiation therapy).

Patients with a poor prognosis from the original breast cancer should not submit to reconstruction for 18 to 24 months except in unusual circumstances.

Many patients who had mastectomies 10 to 20 years ago are requesting reconstruction, and most come to be very satisfied.

Immediate Reconstruction

After it has been determined that the patient is a suitable candidate for reconstruction at the time of the mastectomy, the general surgeon and plastic surgeon will plan the procedure together. If possible and appropriate, based on the primary breast cancer location, a transverse or slightly curved "S"-shaped incision extending obliquely from the medial aspect of the breast toward the upper, outer quadrant and anterior axillary line would be preferred. It must be remembered that the primary objective is adequate surgical treatment of the patient's breast cancer, and reconstructive ef-

Figure 1B. The same patient is shown two and a half years postoperatively. She had an initial immediate breast reconstruction following a modified radical mastectomy with insertion of the prosthesis in the subseratus, subpectoral muscle pocket. A subcutaneous mastectomy had also been performed on the opposite breast. A prosthesis with 250 cc. volume was inserted bilaterally. The nipple was constructed by nipple sharing and the areola was constructed utilizing a groin graft.

forts, although they are important, should be of secondary importance. No effort should be made that compromises the original ablative procedure in order to facilitate the reconstruction.

The basic technique for the placement of the breast implant at the time of the original mastectomy involves development of a submuscular pocket at the level of the sixth or seventh rib. A submuscular plane is developed after elevating the serratus musculature from the ribs, then extending superiorly under the pectoralis major muscle. The submuscular pocket is also extended medially beneath the fascial attachments of the rectus abdominus muscle and laterally as well to the anterior axillary area. A suitably sized prosthesis is inserted into the submuscular pocket and the skin is closed (figure 1A, B).

If the overlying skin is extremely tight or cannot be closed after the prosthesis has been placed in the submuscular pocket, then the best procedure is insertion of a tissue expander.^{10,11} This is an inflatable prosthesis with a remote subcutaneous reservoir which is gradually expanded over a period of several weeks to months. After adequate breast size, shape and contour are obtained, the tissue expander is removed and a final prosthesis is inserted. During this stage,

Figure 2A. Preoperative front view of a 40-year-old patient who had a right modified mastectomy one year previously for intraductal carcinoma without nodal involvement.

Figure 2B. A one-year postoperative view of the same patient following a two-stage reconstruction and nipple areola reconstruction.

adjustments will have to be made in the opposite breast to achieve symmetry. At the time of the removal of the tissue expander, in the ideal situation, nipple areolar reconstruction can be carried out as well as adjustment of the skin envelope to match the opposite breast so a symmetrical appearance is obtained.

Delayed Reconstruction

A variety of techniques are available for delayed breast reconstruction. In the patient who has adequate skin and muscle coverage, reconstruction can be carried out with the placement of a subseratus, subpectoral silicone gel prosthesis if the opposite breast is not too large. In a patient with a larger opposite breast with adequate skin and muscle coverage, a tissue expander is placed in a submuscular position. These prostheses are generally inserted through an inframammary incision. This conservative technique is the most common method of breast reconstruction. An adjustment of the opposite breast can be made by mastopexy, reduction, augmentation, or subcutaneous mastectomy, depending on the medical and surgical needs of the patient (figure 2A, B).

In many situations, when there is inadequate muscle or skin coverage, tissue must be brought in from a distant area to augment the deficiency and allow for an adequate breast size. There are two basic techniques used to bring in distant

tissue: the latissimus dorsi myocutaneous flap and the rectus abdominus myocutaneous flap.¹²⁻¹⁸

The latissimus dorsi musculocutaneous flap provides a large triangular area of latissimus muscle across the back. A significant area of skin overlying the muscle may also be transferred. The muscle allows for replacement of muscle coverage which may have been lost at the time of the initial mastectomy and also augments the locally available skin on the anterior chest area. This flap is extremely reliable when rotated on its primary vascular pedicle, the thoraco-dorsal artery and vein. A prosthesis may be inserted immediately to provide for a single-stage replacement of tissue deficiencies and breast mound reconstruction (figure 3A, B, C, D).

The use of the rectus abdominus musculocutaneous flap in breast reconstruction produces excellent results in the appropriately selected patient. This flap usually obviates the need for a silicone prosthesis and eliminates the inherent problems with the possible development of late capsular formation and firmness; however, this flap is the most involved and complicated of the breast reconstruction procedures. The method results in a large amount of tissue which allows for the complete reconstruction of the breast without the use of a silicone prosthesis.

Unfortunately, many patients have had prior abdominal procedures which limit the use of this type of reconstruction. In obese patients, it is difficult to secure an adequate blood supply to the transferred tissue, and yet in extremely thin patients it is difficult to obtain a sufficient amount of tissue

Figure 3A, B. A 43-year-old patient is shown six months after a modified radical mastectomy for a ductal carcinoma.

Figure 3C, D. The same patient is shown one year later. the breast has been reconstructed using a latissimus dorsi musculocutaneous flap, with a groin graft for areola reconstruction, and nipple sharing. A left subcutaneous mastectomy was also carried out.

Figure 4A, B. A 48-year-old patient is shown 8 months after a modified radical mastectomy for an infiltrating lobular carcinoma of the right breast. There was a lack of sufficient skin and muscle for the standard reconstruction.

to reconstruct the breast mound. An ellipse of lower abdominal skin is elevated on one or both rectus abdominus muscles, and after transfer to the chest area, the flap is folded and inset to create a breast mound. The abdominal wall defect and the skin defect of the lower abdominal wall are closed directly (figure 4A, B, C, D).

Nipple Areola Reconstruction

Nipple areola reconstruction is generally carried out as a final step in breast reconstruction. Prior to nipple reconstruction, the breast mound should be symmetrical and the settling process completed to allow for stable long-term nipple positioning. The areola is usually constructed by the placement of a full-thickness skin graft which is obtained from the groin area. The actual nipple can be constructed either by a local skin flap or by nipple sharing, in which the opposite nipple is halved and transported as a composite graft. In certain situations, the nipple itself may be tattooed to give it a better color match with the opposite nipple.^{17,18}

Discussion

At this time there are a variety of techniques available for breast reconstruction. In any individual patient, several different methods might be used to reconstruct the breast. There is no single best technique. Instead, the selection of the best method of reconstruction should be made on an individual basis. Many a patient with breast cancer will develop recurrent disease during her lifetime. Breast reconstruction has not interfered with the detection of recurrent breast cancer and has no bearing on the destiny of the patient.^{19,20}

Psychological studies have shown that there is a definite psychological benefit derived from breast reconstruction. Those women who submitted to immediate breast reconstruction exhibited a better adjustment to the loss of a breast than those who did not.⁵ ■

We're Here For You, North Carolina

Medical Mutual Insurance Company was created by North Carolina physicians in 1975 to stabilize the volatile professional liability insurance market. For eleven years, we have been able to keep that market open for all physicians in North Carolina. Because our primary goal is stability—not profit—we will continue to serve you while other companies limit their markets or restrict coverage.

Our presence in North Carolina guarantees that experienced physicians can practice their specialties,

new physicians can begin their practices, and citizens of the state will get the high quality medical care they deserve. By bringing stability to the professional liability market, we're serving the public good.

Medical Mutual. We'll be there when you need us.

Medical Mutual
Medical Insurance Agency, Inc.

Medical Mutual Insurance Company of North Carolina and its subsidiary, Medical Insurance Agency, Inc. are located at 222 North Person Street, Raleigh, NC 27611 919/828-9334 800/662-7917

Follow-Up of the Breast Cancer Patient

Donald R. Lannin, M.D.

Although diagnosis and treatment of breast cancer patients receives much attention, follow-up of the breast cancer patient after treatment is frequently ignored or performed in a haphazard fashion. It is important that the breast cancer patient be fully rehabilitated and lead a normal and unrestricted life, but it is equally important that she and her physicians realize that she is at increased risk for certain problems and that she will require specialized follow-up for the rest of her life.

One of the reasons follow-up is frequently disorganized is that there are usually several physicians involved in the care of the breast cancer patient. In addition to the primary care physician and the surgeon, there is often a medical oncologist, a radiation therapist, and a plastic surgeon. Sometimes each of these specialists duplicates follow-up care, but other times no one takes responsibility as each assumes the other is doing it. It is important that the follow-up be planned among these specialists so that the patient receives coordinated and cost-effective care.

There are two main goals in follow-up of the breast cancer patient in addition to ensuring adequate rehabilitation from the effects of the cancer and its treatment. First is to detect recurrent disease at a point when it may still be curable or at least most effectively palliated. Second is to detect associated new primary cancers at a stage when they have a high chance of being cured. This article will briefly discuss each of these goals.

When and Where is Breast Cancer Likely to Recur?

In order to detect recurrent disease in an efficient and cost-effective manner, the physician must have a realistic idea of the probability of recurrence. Breast cancer is somewhat different from most other cancers as it can recur quite late. Nevertheless, the majority of patients who suffer recurrence

will do so within the first five years. An additional 10% of breast cancers will recur at between 5 and 10 years and another 5% after 10 years. If all stages are considered together, the chances of recurrence are 35% at 5 years, 45% at 10 years, and 50% at 20 years. However, the prognosis depends markedly on the size of the primary tumor, the presence or absence of involved axillary lymph nodes, the age and race of the patient, the presence of hormone receptors in the tumor, and the histological type of the tumor. If the lymph nodes are negative, the chance of recurrence is 20% at 10 years; if positive, 70% at 10 years. All these factors must be taken into account in assessing an individual patient's likelihood of recurrence.

Knowledge of the anatomic patterns of recurrence aids the physician in planning follow-up care. About 5% to 10% of patients will develop a local recurrence — i.e., a recurrence in the mastectomy scar, in the axilla, or in the remainder of the breast if the patient was treated with partial mastectomy, axillary dissection, and radiation therapy. However, the majority of patients in whom disease recurs will develop distant metastases. These occur in the following order of frequency: bone; lungs; soft tissue; liver; and brain.

Detection of Recurrence

Follow-up should be directed toward detecting recurrent disease at a stage when it is still curable or when it is most effectively palliated. There is little benefit in frequent exhaustive tests which can only diagnose incurable disease. The plan for follow-up should be individualized for each patient to take into account her risk for certain types of recurrence. For example, a woman who had a small tumor and negative axillary lymph nodes is at relatively low risk for recurrence and it would be a mistake to obtain frequent, expensive x-rays or scans if she remains asymptomatic. On the other hand, it must be recognized that a woman with a large primary tumor is at high risk for local recurrence, irrespective of her risk for systemic disease, and therefore frequent physical exams looking for local recurrence would be indicated.

From Department of Surgery, Assistant Professor and Chief of Surgical Oncology, East Carolina University School of Medicine, Greenville 27858.

The following few paragraphs provide some general guidelines for follow-up of women with Stage I or II disease who have received curative treatment.

Over 75% of recurrent breast cancer is detected by history and physical exam alone. Usually this should be performed every three to four months for the first year or two, and every six months following this. History should be particularly directed toward symptoms of bone pain, shortness of breath, weight loss, or neurological changes. Physical exam should be directed toward any evidence of local recurrence in the surgical scar, axilla, or supraclavicular lymph nodes, as well as evidence of pleural effusion or hepatomegaly. If the patient has been treated by partial mastectomy, axillary dissection, and radiation therapy, it is especially important to examine the remainder of the breast for local recurrence since current evidence suggests that these patients may still be cured by mastectomy. Examination of the opposite breast for a new primary is also important and will be discussed below.

Evaluation of serum calcium, alkaline phosphatase, and hematocrit are relatively inexpensive and many authorities recommend they be obtained every six to 12 months. Carcinoembryonic antigen may be helpful in patients undergoing treatment for metastatic disease, but it is not worthwhile for following asymptomatic patients. Most authorities recommend yearly mammograms and chest x-rays for anyone who has had breast cancer. Bone scans and CT scans may be indicated in patients with suggestive symptoms, but are not worthwhile to screen asymptomatic patients. They are expensive and have a relatively high incidence of false positives and false negatives. Furthermore, when positive, they indicate incurable disease and there is no evidence that palliation is improved by starting treatment before the disease becomes clinically apparent.

Detection of Associated New Primary Cancers

Follow-up of breast cancer patients should be directed toward early detection of associated new primaries as well as toward detection of recurrent disease. A patient who has had a breast cancer in one breast has at least a 10% chance of developing a new primary in the opposite breast. In addition, there is a slightly increased risk of cancer of the colon, endometrium, and ovary. Emphasis should be placed on detecting these malignancies early when they have an extremely high cure rate. New primary breast cancer can be detected most effectively by a careful physical examination of the breast at each visit, by yearly mammograms, and by encouraging the patient to perform monthly breast self examination. Carcinoma of the colon can be detected by rectal examination, sigmoidoscopy and stool guaiac determination. ■

Before prescribing, see complete prescribing information in SK&F CO. literature or PDR. The following is a brief summary.

WARNING

This drug is not indicated for initial therapy of edema or hypertension. Edema or hypertension requires therapy titrated to the individual. If this combination represents the dosage so determined, its use may be more convenient in patient management. Treatment of hypertension and edema is not static, but must be reevaluated as conditions in each patient warrant.

Contraindications: Concomitant use with other potassium-sparing agents such as spironolactone or amiloride. Further use in anuria, progressive renal or hepatic dysfunction, hyperkalemia. Pre-existing elevated serum potassium. Hypersensitivity to either component or other sulfonamide-derived drugs.

Warnings: Do not use potassium supplements, dietary or otherwise, unless hypokalemia develops or dietary intake of potassium is markedly impaired. If supplementary potassium is needed, potassium tablets should not be used. Hyperkalemia can occur, and has been associated with cardiac irregularities. It is more likely in the severely ill, with urine volume less than one liter/day, the elderly and diabetics with suspected or confirmed renal insufficiency. Periodically serum K⁺ levels should be determined. If hyperkalemia develops, substitute a thiazide alone, restrict K⁺ intake. Associated widened QRS complex or arrhythmia requires prompt additional therapy. Thiazides cross the placental barrier and appear in cord blood. Use in pregnancy requires weighing anticipated benefits against possible hazards, including fetal or neonatal jaundice, thrombocytopenia, other adverse reactions seen in adults. Thiazides appear and triamterene may appear in breast milk. If their use is essential, the patient should stop nursing. Adequate information on use in children is not available. Sensitivity reactions may occur in patients with or without a history of allergy or bronchial asthma. Possible exacerbation or activation of systemic lupus erythematosus has been reported with thiazide diuretics.

Precautions: The bioavailability of the hydrochlorothiazide component of 'Dyazide' is about 50% of the bioavailability of the single entity. Theoretically, a patient transferred from the single entities of triamterene and hydrochlorothiazide may show an increase in blood pressure or fluid retention. Similarly, it is also possible that the lesser hydrochlorothiazide bioavailability could lead to increased serum potassium levels. However, extensive clinical experience with 'Dyazide' suggests that these conditions have not been commonly observed in clinical practice. Angiotensin-converting enzyme (ACE) inhibitors can elevate serum potassium; use with caution with 'Dyazide'. Do periodic serum electrolyte determinations (particularly important in patients vomiting excessively or receiving parenteral fluids, and during concurrent use with amphotericin B or corticosteroids or corticotropin [ACTH]). Periodic BUN and serum creatinine determinations should be made, especially in the elderly, diabetics or those with suspected or confirmed renal insufficiency. Cumulative effects of the drug may develop in patients with impaired renal function. Thiazides should be used with caution in patients with impaired hepatic function. They can precipitate coma in patients with severe liver disease. Observe regularly for possible blood dyscrasias, liver damage, other idiosyncratic reactions. Blood dyscrasias have been reported in patients receiving triamterene, and leukopenia, thrombocytopenia, agranulocytosis, and aplastic and hemolytic anemia have been reported with thiazides. Thiazides may cause manifestation of latent diabetes mellitus. The effects of oral anticoagulants may be decreased when used concurrently with hydrochlorothiazide; dosage adjustments may be necessary. Clinically insignificant reductions in arterial responsiveness to norepinephrine have been reported. Thiazides have also been shown to increase the paralyzing effect of nondepolarizing muscle relaxants such as tubocurarine. Triamterene is a weak folic acid antagonist. Do periodic blood studies in cirrhotics with splenomegaly. Antihypertensive effects may be enhanced in post-sympathectomy patients. Use cautiously in surgical patients. Triamterene has been found in renal stones in association with the other usual calculus components. Therefore, 'Dyazide' should be used with caution in patients with histories of stone formation. A few occurrences of acute renal failure have been reported in patients on 'Dyazide' when treated with indomethacin. Therefore, caution is advised in administering nonsteroidal anti-inflammatory agents with 'Dyazide'. The following may occur: transient elevated BUN or creatinine or both, hyperglycemia and glycosuria (diabetic insulin requirements may be altered), hyperuricemia and gout, digitalis intoxication (in hypokalemia), decreasing alkali reserve with possible metabolic acidosis. 'Dyazide' interferes with fluorescent measurement of quinidine. Hypokalemia is uncommon with 'Dyazide', but should it develop, corrective measures should be taken such as potassium supplementation or increased dietary intake of potassium-rich foods. Corrective measures should be instituted cautiously and serum potassium levels determined. Discontinue corrective measures and 'Dyazide' should laboratory values reveal elevated serum potassium. Chloride deficit may occur as well as dilutional hyponatremia. Concurrent use with chlorpropamide may increase the risk of severe hyponatremia. Serum PBI levels may decrease without signs of thyroid disturbance. Calcium excretion is decreased by thiazides. 'Dyazide' should be withdrawn before conducting tests for parathyroid function. Thiazides may add to or potentiate the action of other antihypertensive drugs. Diuretics reduce renal clearance of lithium and increase the risk of lithium toxicity.

Adverse Reactions: Muscle cramps, weakness, dizziness, headache, dry mouth, anaphylaxis, rash, urticaria, photosensitivity, purpura, other dermatological conditions; nausea and vomiting, diarrhea, constipation, other gastrointestinal disturbances; postural hypotension (may be aggravated by alcohol, barbiturates, or narcotics). Necrotizing vasculitis, paresthesias, icterus, pancreatitis, xanthopsia and respiratory distress including pneumonitis and pulmonary edema, transient blurred vision, sialadenitis, and vertigo have occurred with thiazides alone. Triamterene has been found in renal stones in association with other usual calculus components. Rare incidents of acute interstitial nephritis have been reported. Impotence has been reported in a few patients on 'Dyazide', although a causal relationship has not been established.

Supplied: 'Dyazide' is supplied as a red and white capsule, in bottles of 1000 capsules; Single Unit Packages (unit-dose) of 100 (intended for institutional use only); in Patient-Pak™ unit-of-use bottles of 100.

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION AND PATIENT INFORMATION, SEE PACKAGE CIRCULARS)

PREMARIN® Brand of conjugated estrogens tablets, USP
PREMARIN® Brand of conjugated estrogens Vaginal Cream, in a nonliquefying base

1 ESTROGENS HAVE BEEN REPORTED TO INCREASE THE RISK OF ENDOMETRIAL CARCINOMA

Three independent, case-controlled studies have reported an increased risk of endometrial cancer in postmenopausal women exposed to exogenous estrogens for more than one year. This risk was independent of the other known risk factors for endometrial cancer. These studies are further supported by the finding that incidence rates of endometrial cancer have increased sharply since 1969 in eight different areas of the United States with population-based cancer reporting systems, an increase which may be related to the rapidly expanding use of estrogens during the last decade. The three case-controlled studies reported that the risk of endometrial cancer in estrogen users was about 4.5 to 13.9 times greater than in nonusers. The risk appears to depend on both duration of treatment and on estrogen dose. In view of these findings, when estrogens are used for the treatment of menopausal symptoms, the lowest dose that will control symptoms should be utilized and medication should be discontinued as soon as possible. When prolonged treatment is medically indicated, the patient should be reassessed on at least a semi-annual basis to determine the need for continued therapy. Although the evidence must be considered preliminary, one study suggests that cyclic administration of low doses of estrogen may carry less risk than continuous administration. If therefore appears prudent to utilize such a regimen. Close clinical surveillance of all women taking estrogens is important. In all cases of undiagnosed persistent or recurring abnormal vaginal bleeding, adequate diagnostic measures should be undertaken to rule out malignancy. There is no evidence at present that "natural" estrogens are more or less hazardous than "synthetic" estrogens at equi-estrogenic doses.

2 ESTROGENS SHOULD NOT BE USED DURING PREGNANCY

The use of female sex hormones, both estrogens and progestogens, during early pregnancy may seriously damage the offspring. It has been shown that females exposed in utero to diethylstilbestrol, a nonsteroidal estrogen, have an increased risk of developing in later life, a form of vaginal or cervical cancer that is ordinarily extremely rare. This risk has been estimated as not greater than 4 per 1,000 exposures. Furthermore, a high percentage of such exposed women (from 30% to 90%) have been found to have vaginal adenosis, epithelial changes of the vagina and cervix. Although these changes are histologically benign, it is not known whether they are precursors of malignancy. Although similar data are not available with the use of other estrogens, it cannot be presumed they would not induce similar changes. Several reports suggest an association between intrauterine exposure to female sex hormones and congenital anomalies, including congenital heart defects and limb-reduction defects. One case-controlled study estimated a 4.7-fold increased risk of limb-reduction defects in infants exposed in utero to sex hormones (oral contraceptives, hormone withdrawal tests for pregnancy, or attempted treatment for threatened abortion). Some of these exposures were very short and involved only a few days of treatment. The data suggest that the risk of limb-reduction defects in exposed fetuses is somewhat less than 1 per 1,000. In the past, female sex hormones have been used during pregnancy in an attempt to treat threatened or habitual abortion. There is considerable evidence that estrogens are ineffective for these indications, and there is no evidence from well-controlled studies that progestogens are effective for these uses. If PREMARIN is used during pregnancy, or if the patient becomes pregnant while taking this drug, she should be apprised of the potential risks to the fetus, and the advisability of pregnancy continuation.

DESCRIPTION: PREMARIN (conjugated estrogens, USP) contains a mixture of estrogens, obtained exclusively from natural sources, blended to represent the average composition of material derived from pregnant mares' urine. It contains estrone, equilin, and 17 α -dihydroequilin, together with smaller amounts of 17 α -estradiol, equilin, and 17 α -dihydroequilin as salts of their sulfate esters. Tablets are available in 0.3 mg, 0.625 mg, 0.9 mg, 1.25 mg, and 2.5 mg strengths of conjugated estrogens. Cream is available as 0.625 mg conjugated estrogens per gram.

INDICATIONS AND USAGE: PREMARIN (conjugated estrogens tablets, USP): Moderate-to-severe vasomotor symptoms associated with the menopause. (There is no evidence that estrogens are effective for nervous symptoms or depression without associated vasomotor symptoms and they should not be used to treat such conditions.) Osteoporosis (abnormally low bone mass). Atrophic vaginitis. Kraurosis vulvae. Female castration. PREMARIN (conjugated estrogens) Vaginal Cream is indicated in the treatment of atrophic vaginitis and kraurosis vulvae.

PREMARIN HAS NOT BEEN SHOWN TO BE EFFECTIVE FOR ANY PURPOSE DURING PREGNANCY AND ITS USE MAY CAUSE SEVERE HARM TO THE FETUS (SEE BOXED WARNING).

Concomitant Progestin Use: The lowest effective dose appropriate for the specific indication should be utilized. Studies of the addition of a progestin for 7 or more days of a cycle of estrogen administration have reported a lowered incidence of endometrial hyperplasia. Morphological and biochemical studies of the endometrium suggest that 10 to 13 days of progestin are needed to provide maximal maturation of the endometrium and to eliminate any hyperplastic changes. Whether this should provide protection from endometrial carcinoma has not been clearly established. There are possible additional risks which may be associated with the inclusion of progestin in estrogen replacement regimens. (See PRECAUTIONS.) The choice of progestin and dosage may be important; product labeling should be reviewed to minimize possible adverse effects.

CONTRAINDICATIONS: Estrogens should not be used in women (or men) with any of the following conditions: 1. Known or suspected cancer of the breast except in appropriately selected patients being treated for metastatic disease. 2. Known or suspected estrogen-dependent neoplasia. 3. Known or suspected pregnancy (see Boxed Warning). 4. Undiagnosed abnormal genital bleeding. 5. Active thrombophlebitis or thromboembolic disorders. 6. A past history of thrombophlebitis, thrombosis, or thromboembolic disorders associated with previous estrogen use (except when used in treatment of breast or prostatic malignancy).

WARNINGS: Estrogens have been reported to increase the risk of endometrial carcinoma (see Boxed Warning). However, a recent large, case-controlled study indicated no increase in risk of breast cancer in postmenopausal women. A recent study has reported a 2- to 3-fold increase in the risk of surgically confirmed gallbladder disease in women receiving postmenopausal estrogens.

Adverse effects of oral contraceptives may be expected at the larger doses of estrogen used to treat prostatic or breast cancer or postpartum breast engorgement, it has been shown that there is an increased risk of thrombosis in men receiving estrogens for prostatic cancer and women for postpartum breast engorgement. Users of oral contraceptives have an increased risk of diseases, such as thrombophlebitis, pulmonary embolism, stroke, and myocardial infarction. Cases of retinal thrombosis, mesenteric thrombosis, and optic neuritis have been reported in oral contraceptive users. An increased risk of postsurgery thromboembolic complications has also been reported in users of oral contraceptives. If feasible, estrogen should be discontinued at least 4 weeks before surgery of the type associated with an increased risk of thromboembolism, or during periods of prolonged immobilization. Estrogens should not be used in persons with active thrombophlebitis, thromboembolic disorders, or in persons with a history of such disorders in association with estrogen use. They should be used with caution in patients with cerebral vascular or coronary artery disease. Large doses (5 mg conjugated estrogens per day), comparable to those used to treat cancer of the prostate and breast, have been shown to increase the risk of nonfatal myocardial infarction, pulmonary embolism, and thrombophlebitis. When doses of this size are used, any of the thromboembolic and thrombotic adverse effects should be considered a clear risk.

For atrophic vaginitis

PREMARIN® (conjugated estrogens)

Vaginal Cream
0.625 mg/g

Benign hepatic adenomas should be considered in estrogen users having abdominal pain and tenderness, abdominal mass, or hypovolemic shock. Hepatocellular carcinoma has been reported in women taking estrogen-containing oral contraceptives. Increased blood pressure may occur with use of estrogens in the menopause and blood pressure should be monitored with estrogen use. A worsening of glucose tolerance has been observed in patients on estrogen-containing oral contraceptives. For this reason, diabetic patients should be carefully observed. Estrogens may lead to severe hypercalcemia in patients with breast cancer and bone metastases.

PRECAUTIONS: Physical examination and a complete medical and family history should be taken prior to the initiation of any estrogen therapy with special reference to blood pressure, breasts, abdomen, and pelvic organs, and should include a Papanicolaou smear. As a general rule, estrogen should not be prescribed for longer than one year without another physical examination being performed. Conditions influenced by fluid retention, such as asthma, epilepsy, migraine, and cardiac or renal dysfunction, require careful observation. Certain patients may develop manifestations of excessive estrogenic stimulation, such as abnormal or excessive uterine bleeding, mastodynia, etc. Prolonged administration of unopposed estrogen therapy has been reported to increase the risk of endometrial hyperplasia in some patients. Oral contraceptives appear to be associated with an increased incidence of mental depression. Patients with a history of depression should be carefully observed. Pre-existing uterine leiomyomata may increase in size during estrogen use. The pathologist should be advised of estrogen therapy when relevant specimens are submitted. If jaundice develops in any patient receiving estrogen, the medication should be discontinued while the cause is investigated. Estrogens should be used with care in patients with impaired liver function, renal insufficiency, metabolic bone diseases associated with hypercalcemia or in young patients in whom bone growth is not yet complete. If concomitant progestin therapy is used, potential risks may include adverse effects on carbohydrate and lipid metabolism.

The following changes may be expected with larger doses of estrogen.

- a. Increased sulfobromophthalein retention
- b. Increased prothrombin and factors VII, VIII, IX, and X, decreased antithrombin III, increased norepinephrine-induced platelet aggregability
- c. Increased thyroid binding globulin (TBG) leading to increased circulating total thyroid hormone, as measured by PBI, T_4 by column, or T_4 by radioimmunoassay. Free T_3 resin uptake is decreased, reflecting the elevated TBG. Free T_4 concentration is unaltered.
- d. Impaired glucose tolerance
- e. Decreased pregnandiol excretion
- f. Reduced response to methylxanthine test
- g. Reduced serum folate concentration
- h. Increased serum triglyceride and phospholipid concentration

As a general principle, the administration of any drug to nursing mothers should be done only when clearly necessary since many drugs are excreted in human milk.

Long-term, continuous administration of natural and synthetic estrogens in certain animal species increases the frequency of carcinomas of the breast, cervix, vagina, and liver. However, in a recent, large case-controlled study of postmenopausal women there was no increase in risk of breast cancer with use of conjugated estrogens.

ADVERSE REACTIONS: The following have been reported with estrogenic therapy, including oral contraceptives: breakthrough bleeding, spotting, change in menstrual flow, dysmenorrhea, premenstrual-like syndrome, amenorrhea during and after treatment, increase in size of uterine fibromyomata, vaginal candidiasis, change in cervical erosion and in degree of cervical secretion, cystitis-like syndrome, tenderness, enlargement, secretion (of breasts), nausea, vomiting, abdominal cramps, bloating, cholestatic jaundice, chloasma or melasma which may persist when drug is discontinued, erythema multiforme, erythema nodosum, hemorrhagic eruption, loss of scalp hair, hirsutism, steepening of corneal curvature, intolerance to contact lenses, headache, migraine, dizziness, mental depression, chorea, increase or decrease in weight, reduced carbohydrate tolerance, aggravation of porphyria, edema, changes in libido.

ACUTE OVERDOSEAGE: May cause nausea, and withdrawal bleeding may occur in females.

DOSAGE AND ADMINISTRATION:

PREMARIN® Brand of conjugated estrogens tablets, USP

1. *Given cyclically for short-term use only.* For treatment of moderate-to-severe vasomotor symptoms, atrophic vaginitis, or kraurosis vulvae associated with the menopause (0.3 mg to 1.25 mg or more daily). The lowest dose that will control symptoms should be chosen and medication should be discontinued as promptly as possible. Administration should be cyclic (eg, three weeks on and one week off). Attempts to discontinue or taper medication should be made at three- to six-month intervals.

2. *Given cyclically.* Osteoporosis: Female castration—0.625 mg daily. Administration should be cyclic (eg, three weeks on and one week off). Female castration—1.25 mg daily cyclically. Adjust upward or downward according to response of the patient. For maintenance, adjust dosage to lowest level that will provide effective control.

Patients with an intact uterus should be monitored for signs of endometrial cancer and appropriate measures taken to rule out malignancy in the event of persistent or recurring abnormal vaginal bleeding.

PREMARIN® Brand of conjugated estrogens Vaginal Cream

Given cyclically for short-term use only. For treatment of atrophic vaginitis or kraurosis vulvae.

The lowest dose that will control symptoms should be chosen and medication should be discontinued as promptly as possible.

Administration should be cyclic (eg, three weeks on and one week off).

Attempts to discontinue or taper medication should be made at three- to six-month intervals.

Usual dosage range: 2 g to 4 g daily, intravaginally, depending on the severity of the condition.

Treated patients with an intact uterus should be monitored closely for signs of endometrial cancer and appropriate diagnostic measures should be taken to rule out malignancy in the event of persistent or recurring abnormal vaginal bleeding.

Letters to the Editor

A comment on Dr. Landis's article

To the Editor:

I read with interest Dr. Landis's article "To Test or Not To Test" (NCMJ 1987;48:357-62), and would like to offer a few comments from my point of view. Several crucial questions have not been addressed:

1 Under 2 (page 358), are there "efficacious preventive maneuvers for the transmission of Human Immunodeficiency Virus (HIV)"? This question was posed but not answered, and of course changes in lifestyle and condom usage do prevent transmission.

2 Does the future burden of suffering of those not yet infected warrant screening so that those who are infected can be urged to prevent transmission? I doubt if voluntary testing will accomplish this. Voluntary exclusion of donors certainly did not protect the blood supply, and mandatory testing of each unit of blood became necessary.

3 Why are we so vigilant to protect the rights of people receiving transfusions while we do not consider the rights of the uninfected in a promiscuous society?

4 Public Health measures have tried to protect the public health in the past. Why is this infectious and contagious disease different? Because of the long latent period between acquisition of HIV infection and clinical deterioration with HIV disease, an attempt to identify contacts and break the chain of spread would have a chance of being effective. Why must we sit back and wait for people to volunteer for testing or to wait for clinical illness?

5 Why are only the cases of HIV disease reported to public health authorities and not the cases of HIV seropositivity? We used to report all cases with positive serological tests for syphilis.

These are hard questions. I agree with Dr. Landis about the expense of mass screening. However, the costs of caring for increased numbers of cases of HIV will be many times larger. It is a horrendous problem but I think we should roll up our sleeves, get to work and do the mass screening.

Janet J. Fischer, M.D.

Reply from Dr. Landis

To the Editor:

I appreciate Dr. Fischer's comments and questions con-

cerning HIV testing. The published manuscript was one of three presentations concerning HIV testing presented at the 1987 UNC School of Public Health Alumni Conference; the other two presentations covered ethical issues and public health/implementation considerations of mass testing. My presentation obviously covers only one aspect of the issue, i.e., epidemiologic considerations. Most of Dr. Fischer's comments deal with ethical and legal issues which were covered by Dr. Beauchamp and Mr. Jolly. The inclusion of these other two presentations in the journal would have naturally provided a more comprehensive picture of the complex issue of HIV testing.

The major thrust of my talk, and thus the paper, was to alert physicians to the large number of false positive HIV antibody tests (as high as 42%) likely to occur with a mass screening program. By selecting high-risk populations with a higher prevalence of the infection, the accuracy of the tests is markedly improved. I agree with Dr. Fischer that volunteer testing as the sole public health measure is unlikely to be effective in reducing transmission of HIV. A comprehensive approach of education, "self-efficacy" training, mandatory testing of high-risk groups, safe sex, contact notification, sterile needle distributions, organ donor testing, and vaccine development may all eventually be necessary to halt the epidemic.

I agree with Dr. Fischer that lifestyle changes which include reduction in number of sexual partners and condom usage are certainly the mainstay of preventive maneuvers for the transmission of HIV. I do mention some studies regarding behavior changes: (1)homosexual males who have reduced the number of sexual partners and (2)discordant heterosexual couples where one partner is seropositive who have not uniformly used condoms. I doubt that education and behavioral modification will ever be replaced as a major preventive technique, since the estimated 1.5 to 2 million infected persons are unlikely to become uninfected even if antiviral agents are able to retard progression to overt AIDS. People must realize that only partial reduction in high-risk sexual behavior still carries a risk of transmission or seroconverting.

On AIDS transmission

To the Editor:

The definition of knowingly and intentionally transmitting

AIDS as the use of a potentially deadly weapon is receiving increased acceptance. AIDS patients who know that they are communicable and continue their pattern of promiscuous sexual activities are knowingly and intentionally administering a potential lethal injury to an unsuspecting victim. One individual who learned of this retaliated by killing the perpetrator and later utilized his fear, anger, and frustration regarding the assault in his defense. The United States Army is presently conducting trials of several soldiers who continued their sexual activities despite the knowledge of their potentially fatal effects. As a result there has been a great deal of interest in establishing the concept that knowingly and intentionally communicating AIDS to another be defined as a felony. The legal elements of murder are clearly present under such circumstances.

This raises further questions regarding the legal responsibilities of attending physicians who treat AIDS patients who declare to their physician during the course of treatment that they intend to continue their sexual activities despite the clear and imminent danger that they present to others. If and when a competent or an incompetent individual declares a clear intent to harm other individuals and has the means to do so, it is the obligation of the attending physician in some jurisdictions to warn the specific identified victim or to notify the appropriate legal authorities. Some AIDS patients present with dementia and as a result are unable to make competent decisions. In the case of an incompetent patient there is a duty to institute commitment proceeding, when an individual suffers from a mental disorder and as a result of that disorder becomes a danger to others.

Both competent and incompetent communicable AIDS patients actively engage in prostitution and sell blood. This results in a clear danger to unknown members of the community. In such cases the only recourse is to the criminal justice system for the competent individual and to the mental health system for the incompetent individual. It is readily foreseeable, however, that both hospitals and prisons will increase their resistance to the admission of communicable AIDS patients. Federal policy with guidelines and procedures is therefore urgently needed at this time.

On the recent Blue Cross and Blue Shield of NC advertisement

To the Editor

I am disappointed by your decision to run the recent Blue Cross/Blue Shield PCP advertisement in your July issue. In my opinion it evinces the empty personal lives of many "good doctors."

After an informal poll of my colleagues, I find that I'm not alone in thinking that this ad (which portrays a woman and her two children waiting for their doctor/husband/father to come home) is sexist, antifamily and a selfish medical stance. Families and spouses have by tradition been sacrificed for the needs of patients, and the inability of practitioners and educators to determine the relevant weight of patient's needs versus personal and family needs erodes the idealism students bring to medicine. Families and spouses should be more than neglectable possessions.

Without a doubt the personal sacrifices alluded to in this ad exist and will continue to exist in medicine. I'm not, however, proud of the fact that my family suffers my sacrifices and I would shun recounting this to the public as some badge of courage.

Shame on Blue Cross/Blue Shield for portraying this side of medicine as illustrating quality care and the "good" in doctors.

William Fulcher, M.D.
Snow Hill Medical Center
302 North Greene Street
Snow Hill 28580

Editor's Note:

Mr. James R. Singleton of Blue Cross and Blue Shield of NC has informed us that the "waiting room" ad was shown to a number of physicians in order to test response, and that the response was uniformly positive. He said physicians commented that the ad warmly and accurately pointed out sacrifices that are often unappreciated and overlooked.

Continuing Medical Education

Please note: The Continuing Medical Education Programs at Bowman Gray, Duke, East Carolina (ECU) and UNC Schools of Medicine, and Dorothea Dix are accredited by the American Medical Association. Therefore CME programs sponsored or cosponsored by these schools automatically qualify for AMA Category I credit toward the AMA's Physician Recognition Award, and for North Carolina Medical Society Category A credit. Where AAFP credit has been obtained, this also is indicated.

In Memoriam

Arlie H. Westfall, M.D.

Whereas, Arlie H. Westfall, M.D., died on May 22, 1987, after a dedicated and exemplary career as a physician in medicine, and

Whereas, Dr. Arlie H. Westfall was born in Enterprise, West Virginia, and graduated from the Fairmont State College, Fairmont, West Virginia, in 1950. He attended the West Virginia School of Medicine and graduated from the Medical College of Virginia in 1955. He was a resident in obstetrics and gynecology at the Medical College of Virginia.

While serving in the U.S. Army, he practiced at Fort Sill Army Hospital, Fort Wainwright Army Hospital, Fitzsimons General Hospital, and the Medical Center Hospital of Odessa, Texas.

He was a member of the American College of Obstetrics and Gynecology and certified by the American Board of Obstetrics and Gynecology.

Dr. Westfall was a member of the American Medical Association, Southern Medical Association, North Carolina Medical Society, North Carolina Society of Obstetrics and

Gynecology, Past President of the Robeson County Medical Society, and at his death was serving as Chief of Surgery at the Southeastern General Hospital, Lumberton, N.C. He was also a charter member of the Southeastern Mental Health Clinic, Physicians Health Plan, and member of the Hudmalls-Ware Society in Virginia.

He began the practice of obstetrics and gynecology at the Southeastern General Hospital in 1966 and was an associate of the Lumberton Clinic of Obstetrics and Gynecology.

He was extremely active in his community and was an avid hunter and pilot. He loved fishing, camping, and flying with his family and friends.

Dr. Westfall was a dedicated and energetic physician in the practice of obstetrics and gynecology and was much loved by his patients and colleagues. He was a devoted husband, father, and grandfather.

Whereas, his loss as a leader in our profession and our community, as a friend, and as an excellent physician will leave a vacancy to those who depended on him for advice and counsel; therefore be it

RESOLVED, that the Robeson County Medical Society record its sorrow at the loss of our friend and colleague, and be it further

RESOLVED, that a copy of this resolution be sent to Dr. Westfall's family and the North Carolina Medical Journal.

D.E. Ward, Jr., M.D.

In moderate depression and anxiety

Limbitrol[®]

Each tablet contains 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt) 

Limbitrol DS[®]

Each tablet contains 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt) 

References: 1. Feighner JP, et al. *Psychopharmacology* 61: 217-225, Mar 22, 1979. 2. Data on file, Hoffmann-La Roche Inc., Nutley, NJ.

Limbitrol[®] Tranquilizer—Antidepressant

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Relief of moderate to severe depression associated with moderate to severe anxiety.
Contraindications: Known hypersensitivity to benzodiazepines or tricyclic antidepressants. Do not use with monoamine oxidase (MAO) inhibitors or within 14 days following discontinuation of MAO inhibitors since hyperpyretic crises, severe convulsions and deaths have occurred with concomitant use, then initiate cautiously, gradually increasing dosage until optimal response is achieved. Contraindicated during acute recovery phase following myocardial infarction.

Warnings: Use with great care in patients with history of urinary retention or angle-closure glaucoma. Severe constipation may occur in patients taking tricyclic antidepressants and anticholinergic-type drugs. Closely supervise cardiovascular patients (Arrhythmias, sinus tachycardia and prolongation of conduction time reported with use of tricyclic antidepressants, especially high doses. Myocardial infarction and stroke reported with use of this class of drugs.) Caution patients about possible combined effects with alcohol and other CNS depressants and against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving).

Usage in Pregnancy: Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Since physical and psychological dependence to chlordiazepoxide have been reported rarely, use caution in administering Limbitrol to addiction-prone individuals or those who might increase dosage, withdrawal symptoms following discontinuation of either component alone have been reported (nausea, headache and malaise for amitriptyline, symptoms [including convulsions] similar to those of barbiturate withdrawal for chlordiazepoxide).

Precautions: Use with caution in patients with a history of seizures, in hyperthyroid patients or those on thyroid medication, and in patients with impaired renal or hepatic function. Because of the possibility of suicide in depressed patients, do not permit easy access to large quantities in these patients. Periodic liver function tests and blood counts are recommended during prolonged treatment. Amitriptyline component may block action of guanethidine or similar antihypertensives. When tricyclic antidepressants are used concomitantly with cimetidine (Tagamet), clinically significant effects have been reported involving delayed elimination and increasing steady state concentrations of the tricyclic drugs. Concomitant use of Limbitrol with other psychotropic drugs has not been evaluated. Sedative effects may be additive. Discontinue several days before surgery. Limit concomitant administration of ECT to essential treatment. See Warnings for precautions about pregnancy. Limbitrol should not be taken during the nursing period. Not recommended in children under 12. In the elderly and debilitated, limit to smallest effective dosage to preclude ataxia, oversedation, confusion or anticholinergic effects.

Adverse Reactions: Most frequently reported are those associated with either component alone: drowsiness, dry mouth, constipation, blurred vision, dizziness and bloating. Less frequently occurring

reactions include vivid dreams, impotence, tremor, confusion and nasal congestion. Many depressive symptoms including anorexia, fatigue, weakness, restlessness and lethargy have been reported as side effects of both Limbitrol and amitriptyline. Granulocytopenia, jaundice and hepatic dysfunction have been observed rarely.

The following list includes adverse reactions not reported with Limbitrol but requiring consideration because they have been reported with one or both components or closely related drugs.

Cardiovascular: Hypotension, hypertension, tachycardia, palpitations, myocardial infarction, arrhythmias, heart block, stroke.

Psychiatric: Euphoria, apprehension, poor concentration, delusions, hallucinations, hypomania and increased or decreased libido.

Neurologic: Incoordination, ataxia, numbness, tingling and paresthesias of the extremities, extrapyramidal symptoms, syncope, changes in EEG patterns.

Anticholinergic: Disturbance of accommodation, paralytic ileus, urinary retention, dilatation of urinary tract.

Allergic: Skin rash, urticaria, photosensitization, edema of face and tongue, pruritus.

Hematologic: Bone marrow depression including agranulocytosis, eosinophilia, purpura, thrombocytopenia.

Gastrointestinal: Nausea, epigastric distress, vomiting, anorexia, stomatitis, peculiar taste, diarrhea, black tongue.

Endocrine: Testicular swelling and gynecomastia in the male, breast enlargement, galactorrhea and minor menstrual irregularities in the female, elevation and lowering of blood sugar levels, and syndrome of inappropriate ADH (antidiuretic hormone) secretion.

Other: Headache, weight gain or loss, increased perspiration, urinary frequency, mydriasis, jaundice, alopecia, parotid swelling.

Overdosage: Immediately hospitalize patient suspected of having taken an overdose. Treatment is symptomatic and supportive. IV administration of 1 to 3 mg physostigmine salicylate has been reported to reverse the symptoms of amitriptyline poisoning. See complete product information for manifestation and treatment.

Dosage: Individualize according to symptom severity and patient response. Reduce to smallest effective dosage when satisfactory response is obtained. Larger portion of daily dose may be taken at bedtime. Single h.s. dose may suffice for some patients. Lower dosages are recommended for the elderly. Limbitrol DS (double strength) Tablets, initial dosage of three or four tablets daily in divided doses, increased up to six tablets or decreased to two tablets daily as required. Limbitrol Tablets, initial dosage of three or four tablets daily in divided doses, for patients who do not tolerate higher dosages.

How Supplied: Double strength (DS) Tablets, white, film-coated, each containing 10 mg chlordiazepoxide and 25 mg amitriptyline (as the hydrochloride salt), and Tablets, blue, film-coated, each containing 5 mg chlordiazepoxide and 12.5 mg amitriptyline (as the hydrochloride salt). Available in bottles of 100 and 500, Tel-E-Dose[®] packages of 100, Prescription Paks of 50.

THERE IS
SOMETHING
IN OUR NAME
THAT BRINGS YOU
A FEELING OF
SECURITY.

CRUMPTON COMPANY.

Why do so many NC physicians participate in the Crumpton Plan of Disability Income Protection?

THE ANSWER is the 47 years of successful relationship and personal service at claim time!

Yes, the feeling of security as well as economic advantage in knowing the program is a plan of carefully designed benefits.

The plan is not filled with a lot of "purple duck feathers," but provides income when you are unable to produce — not promises, but performance.

Why not call us today to obtain the latest details for your group practice? We are delighted to offer our broadened portfolio of professional insurance.

We're Here For You, North Carolina

Medical Mutual Insurance Company was created by North Carolina physicians in 1975 to stabilize the volatile professional liability insurance market. For eleven years, we have been able to keep that market open for all physicians in North Carolina. Because our primary goal is stability—not profit—we will continue to serve you while other companies limit their markets or restrict coverage.

Our presence in North Carolina guarantees that experienced physicians can practice their specialties,

new physicians can begin their practices, and citizens of the state will get the high quality medical care they deserve. By bringing stability to the professional liability market, we're serving the public good.

Medical Mutual. We'll be there when you need us.

Medical Mutual
Medical Insurance Agency, Inc.

Medical Mutual Insurance Company of North Carolina and its subsidiary, Medical Insurance Agency, Inc. are located at 222 North Person Street, Raleigh, NC 27611 919/828-9334 800/662-7917

Hashimoto's Thyroiditis Presenting as a Retropharyngeal Mass

Warner M. Burch, M.D.

Current textbooks of endocrinology and thyroidology fail to mention that thyroid disease may present as retropharyngeal masses. This report describes a patient who presented with a large retropharyngeal mass that was thought, preoperatively, to represent an ominous process such as infectious or malignant lymphadenopathy. However, open biopsy of the mass was consistent with Hashimoto's thyroiditis. Hashimoto's thyroiditis is a common form of goitrous hypothyroidism, but its presentation as a retropharyngeal mass is most unusual.

Our 55-year-old white woman complained of increasing fullness on the right side of her neck over the prior six months. She occasionally had difficulty in swallowing food. She denied any neck pain, dyspnea, fever, weight loss, hoarseness, or change in temperature preference, bowel habits, or skin texture. There was no history of head or neck irradiation or family history of thyroid disease.

Her weight was 72 kg; height, 168 cm; blood pressure, 125/80; pulse, 80/min. Positive findings included a 5x7 cm firm mass under the midportion of the right sternocleidomastoid muscle. The mass barely moved on swallowing and was contiguous with the right lobe of the thyroid. The isthmus and left lobe of the thyroid were easily palpable and thought to be minimally enlarged. The oropharynx appeared normal, but a mass was noted arising at the level of the tip of the epiglottis, which protruded anteriorly. The mass was covered by normal mucosa. The vocal cords could not be visualized, but the patient's voice was normal. The remainder of the physical exam was normal.

Laboratory Studies

The patient's hemoglobin was 11.8 gm; hematocrit, 34.5%; RBC, 3.67 million (normochromic and normocytic blood film); and WBC, 5300. The urinalysis, serum electrolytes, serum creatinine, calcium, and phosphorus were normal. The serum cholesterol was 217 mg/dl (normal, 120-230).

From Department of Medicine, Duke University Medical Center, Durham 27710.

Thyroid function studies included: T4 (radioimmunoassay), 7.6 μ g/dl (normal, 5.5-11.5); T3U, 40.6% (normal, 35-45); FTI, 3.1 (normal, 2.2-4.7). The serum thyroid-stimulating hormone (TSH) was 35.9 μ U/ml (normal, 0-10).

X-Ray Studies

Lateral roentgenographs of the neck revealed a large retropharyngeal mass (figure 1, left panel; next page). A barium swallow showed the cervical esophagus to be displaced anteriorly (maximal at the level of C3-4), and there was no evidence of invasion of the esophageal mucosa by the retropharyngeal mass. A technetium scan of the thyroid revealed an enlarged thyroid with the right lobe larger than the left. Areas of increased and decreased tracer accumulation were found. A computed tomogram (CT) showed a homogeneous, retropharyngeal soft tissue mass (see figure 1). The mass was more prominent on the right than on the left and extended from the level of the base of the tongue to the level of the sternoclavicular joints. The retropharyngeal mass compressed the hypopharynx but not the trachea (figure 1, right panel). Note that relatively little soft tissue is anterior to the trachea where the thyroid is located (figure 1, left panel). In view of the bilateral findings, the CT interpretation was read as "suspicious for enlarged lymph nodes probably neoplastic either metastatic disease or primary lymphoma (infectious process less likely)." A comment was made that a primary tumor of the thyroid could not be excluded.

Surgical Procedure

Several attempts to intubate the patient were unsuccessful because of the anterior location and compression of the larynx. Adequate airway was assured by tracheostomy performed under local anesthesia. Once the subcutaneous tissues were divided, dense white appearing tumor mass was encountered overlying the trachea. Following the tracheostomy, general anesthesia was administered. The retropharyngeal mass was exposed and a 1x2 cm biopsy was taken. The mass was contiguous with the thyroid. Small pieces of

Figure 1. Radiographs of the neck. The left panel shows a lateral x-ray prior to CT. The right panel demonstrates an axial cut at the level of the hyoid bone. Note the large, homogeneous soft tissue mass that extends bilaterally (arrows) and appears to compromise the hypopharynx (dotted line).

the pretracheal tissue obtained during the tracheostomy and the biopsy of the retropharyngeal mass showed histologic changes of chronic thyroiditis (Hashimoto's type). No further surgery was performed.

The patient was discharged with a No. 4 metal tracheostomy tube and was prescribed L-thyroxine 0.1 mg per day. Within three weeks, she was no longer having dysphagia and the tracheostomy tube was removed. The stoma closed without complications. Over the next year the size of the thyroid gradually decreased. Antimicrosomal thyroid antibodies obtained after surgery were 1:9,600 (normal, < 1:100). Five years later, there is no evidence of any thyroid or retropharyngeal mass. She remains euthyroid on replacement L-thyroxine.

Comment

Retropharyngeal masses of thyroid origin are uncommon, since the thyroid develops anterior to the trachea by an outpouching of the pharyngeal floor (the foramen cecum at the base of the tongue) between the first and second branchial arches. The thyroid migrates to the lower anterior neck in front of the hyoid bone and laryngeal cartilages. Lingual thyroid glands and remnants along the path (thyroglossal duct cysts) attest to this embryology. However, thyroid diseases may present as retropharyngeal masses. Generally, these are continuous with a voluminous goiter wrapping around the trachea and esophagus that is seen in such conditions as congenital goiter¹ or multinodular goiter. Benign thyroid adenomas rarely present as retropharyngeal masses.^{2,3} A case of subacute thyroiditis presenting with retropharyngeal fullness was recently reported.⁴ Retropharyngeal spread of thyroid carcinoma to lymph nodes may also occur.⁵

Another case of Hashimoto's thyroiditis presenting as a retropharyngeal mass has been reported.⁶ However, in that case, the thyroid gland appeared normal and was not biopsied because the retropharyngeal mass had no anatomical continuity with the thyroid. The mass was thought to represent a case of ectopic thyroid formation presumably from squamous metaplasia. In the present case, the thyroid and retropharyngeal mass were histologically proven to be Hashimoto's thyroiditis. The patient had lost thyroid reserve (elevated TSH) and had high titers of thyroid antibodies. Treatment with thyroid replacement was associated with gradual resolution of the retropharyngeal mass. Despite the rarity of thyroid diseases that manifest as retropharyngeal masses, the message is clear: diseases of the thyroid should be included in the differential diagnoses of retropharyngeal masses.

A further lesson to be learned from this case is that needle (fine needle or large cutting needle) aspiration biopsy of the mass probably would have aided with the preoperative diagnosis. Initial thyroid studies demonstrated an elevated TSH. Antithyroid antibodies were obtained postoperatively after the diagnosis was made. Such preoperative information in combination with the fine needle aspiration could have permitted a diagnosis of Hashimoto's thyroiditis and obviated the need for open biopsy. Having a cytopathologist experienced in reading thyroid aspirates is crucial for this route of management. While coexistent thyroid carcinoma or lymphoma could not be totally excluded, some clinicians, after reviewing the thyroid function studies and the presumed findings of chronic lymphocytic thyroiditis on needle biopsy, would have recommended a trial of exogenous thyroid hormone suppression before surgical intervention. However, when there is uncertainty as to diagnosis, open biopsy is indicated. ■

"YES, THERE IS LIFE AFTER BREAST CANCER. AND THAT'S THE WHOLE POINT."

—Ann Jillian

A lot of women are so afraid of breast cancer they don't want to hear about it.

And that's what frightens me.

Because those women won't practice breast self-examination regularly.

Those women, particularly those over 35, won't ask their doctor about a mammogram.

Yet that's what's required for breast cancer to be detected early. When the cure rate is 90%. And when there's a good chance it won't involve the loss of a breast.

But no matter what it involves, take it from someone who's been through it all.

Life is just too wonderful to give up on. And, as I found out, you don't have to give up on any of it. Not work, not play, not even romance.

Oh, there is one thing, though.

You do have to give up being afraid to take care of yourself.

Get a checkup. Life is worth it.

BRIEF SUMMARY

CONTRAINDICATIONS

There are no known contraindications to the use of sucralfate.

PRECAUTIONS

Duodenal ulcer is a chronic, recurrent disease. While short-term treatment with sucralfate can result in complete healing of the ulcer, a successful course of treatment with sucralfate should not be expected to alter the post-healing frequency or severity of duodenal ulceration.

Drug Interactions: Animal studies have shown that the simultaneous administration of CARAFATE with tetracycline, phenytoin, or cimetidine will result in a statistically significant reduction in the bioavailability of these agents. This interaction appears to be nonsystemic in origin, presumably resulting from these agents being bound by CARAFATE in the gastrointestinal tract. The bioavailability of these agents may be restored simply by separating the administration of these agents from that of CARAFATE by two hours. The clinical significance of these animal studies is yet to be defined.

Carcinogenesis, Mutagenesis, Impairment of Fertility: No evidence of drug-related tumorigenicity was found in chronic oral toxicity studies of 24 months' duration conducted in mice and rats at doses up to 1 gm/kg (12 times the human dose). A reproduction study in rats at doses up to 38 times the human dose did not reveal any indication of fertility impairment. Mutagenicity studies have not been conducted.

Pregnancy: Pregnancy Category B. Teratogenicity studies have been performed in mice, rats, and rabbits at doses up to 50 times the human dose and have revealed no evidence of harm to the fetus due to sucralfate. There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Nursing Mothers: It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when sucralfate is administered to a nursing woman.

Pediatric Use: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

Adverse reactions to sucralfate in clinical trials were minor and only rarely led to discontinuation of the drug. In studies involving over 2,500 patients, adverse effects were reported in 121 (4.7%). Constipation was the most frequent complaint (2.2%). Other adverse effects, reported in no more than one of every 350 patients, were diarrhea, nausea, gastric discomfort, indigestion, dry mouth, rash, pruritus, back pain, dizziness, sleepiness, and vertigo.

DOSAGE AND ADMINISTRATION

The recommended adult oral dosage for duodenal ulcer is 1 gm four times a day on an empty stomach.

Antacids may be prescribed as needed for relief of pain but should not be taken within one-half hour before or after sucralfate.

While healing with sucralfate may occur during the first week or two, treatment should be continued for 4 to 8 weeks unless healing has been demonstrated by x-ray or endoscopic examination.

HOW SUPPLIED

CARAFATE (sucralfate) 1-gm pink tablets are supplied in bottles of 100 and in Unit Dose Identification Paks of 100. The tablets are embossed with MARION/1712.

Issued 3/84

Specialized ulcer therapy

When advancing age signals reduced acid secretion

If your duodenal ulcer patient is over 55, decreased mucosal resistance is more likely to cause an ulcer than hypersecretion of acid-pepsin.¹ A tendency toward lower acid secretion with advancing age has been shown.^{2,3}

Declining gastric secretion and age³

CARAFATE® (sucralfate/Marion) makes sense as initial ulcer therapy for the elderly. Carafate provides ulcer

healing rates comparable to H₂ antagonists without the risk of systemic side effects or drug interactions—an important benefit for older patients.

The unique, nonsystemic action of Carafate enhances the body's own ulcer healing ability, strengthening the mucosal structure as it protects damaged tissue from further injury.

When advancing age signals reduced acid secretion, choose the specialized ulcer therapy of safe, nonsystemic Carafate.

Nothing works like

CARAFATE®
sucralfate/Marion

PREMARIN® (conjugated estrogens tablets)

The appearance of these tablets is a trademark of Ayerst Laboratories.

BRIEF SUMMARY (FOR FULL PRESCRIBING INFORMATION AND PATIENT INFORMATION, SEE PACKAGE CIRCULARS)

PREMARIN® Brand of conjugated estrogens tablets, USP
PREMARIN® Brand of conjugated estrogens Vaginal Cream, in a nonliquefying base

1. ESTROGENS HAVE BEEN REPORTED TO INCREASE THE RISK OF ENDOMETRIAL CARCINOMA. Three independent, case-controlled studies have reported an increased risk of endometrial cancer in postmenopausal women exposed to exogenous estrogens for more than one year. This risk was independent of the other known risk factors for endometrial cancer. These studies are further supported by the finding that incidence rates of endometrial cancer have increased sharply since 1969 in eight different areas of the United States with population-based cancer reporting systems, an increase which may be related to the rapidly expanding use of estrogens during the last decade. The three case-controlled studies reported that the risk of endometrial cancer in estrogen users was about 4.5 to 13.9 times greater than in nonusers. The risk appears to depend on both duration of treatment and on estrogen dose. In view of these findings, when estrogens are used for the treatment of menopausal symptoms, the lowest dose that will control symptoms should be utilized and medication should be discontinued as soon as possible. When prolonged treatment is medically indicated, the patient should be reassessed on at least a semi-annual basis to determine the need for continued therapy. Although the evidence must be considered preliminary, one study suggests that cyclic administration of low doses of estrogen may carry less risk than continuous administration, it therefore appears prudent to utilize such a regimen. Close clinical surveillance of all women taking estrogens is important. In all cases of undiagnosed persistent or recurring abnormal vaginal bleeding, adequate diagnostic measures should be undertaken to rule out malignancy. There is no evidence at present that "natural" estrogens are more or less hazardous than "synthetic" estrogens at equi-estrogenic doses. 2. ESTROGENS SHOULD NOT BE USED DURING PREGNANCY.

The use of female sex hormones, both estrogens and progestogens, during early pregnancy may seriously damage the offspring. It has been shown that females exposed in utero to diethylstilbestrol, a nonsteroidal estrogen, have an increased risk of developing, in later life, a form of vaginal or cervical cancer that is ordinarily extremely rare. This risk has been estimated as not greater than 4 per 1,000 exposures. Furthermore, a high percentage of such exposed women (from 30% to 90%) have been found to have vaginal adenosis, epithelial changes of the vagina and cervix. Although these changes are histologically benign, it is not known whether they are precursors of malignancy. Although similar data are not available with the use of other estrogens, it cannot be presumed they would not induce similar changes. Several reports suggest an association between intrauterine exposure to female sex hormones and congenital anomalies, including congenital heart defects and limb-reduction defects. One case-controlled study estimated a 4.7-fold increased risk of limb-reduction defects in infants exposed in utero to sex hormones (oral contraceptives, hormone withdrawal tests for pregnancy, or attempted treatment for threatened abortion). Some of these exposures were very short and involved only a few days of treatment. The data suggest that the risk of limb-reduction defects in exposed fetuses is somewhat less than 1 per 1,000. In the past, female sex hormones have been used during pregnancy in an attempt to treat threatened or habitual abortion. There is considerable evidence that estrogens are ineffective for these indications, and there is no evidence from well-controlled studies that progestogens are effective for these uses. If PREMARIN is used during pregnancy, or if the patient becomes pregnant while taking this drug, she should be apprised of the potential risks to the fetus, and the advisability of pregnancy continuation.

DESCRIPTION: PREMARIN (conjugated estrogens, USP) contains a mixture of estrogens, obtained exclusively from natural sources, blended to represent the average composition of material derived from pregnant mares' urine. It contains estrone, equilin, and 17 α -dihydroequilin, together with smaller amounts of 17 α -estradiol, and 17 α -dihydroequilin as salts of their sulfate esters. Tablets are available in 0.3 mg, 0.625 mg, 0.9 mg, 1.25 mg, and 2.5 mg strengths of conjugated estrogens. Cream is available as 0.625 mg conjugated estrogens per gram.

INDICATIONS AND USAGE: PREMARIN (conjugated estrogens tablets, USP). Moderate-to-severe vasomotor symptoms associated with the menopause. (There is no evidence that estrogens are effective for nervous system or depression without associated vasomotor symptoms and they should not be used to treat such conditions.) Osteoporosis (abnormally low bone mass). Atrophic vaginitis. Kraurosis vulvae. Female castration. PREMARIN (conjugated estrogens) Vaginal Cream is indicated in the treatment of atrophic vaginitis and kraurosis vulvae.

PREMARIN HAS NOT BEEN SHOWN TO BE EFFECTIVE FOR ANY PURPOSE DURING PREGNANCY AND ITS USE MAY CAUSE SEVERE HARM TO THE FETUS (SEE BOXED WARNING).

Concomitant Progestin Use: The lowest effective dose appropriate for the specific indication should be utilized. Studies of the addition of a progestin for 7 or more days of a cycle of estrogen administration have reported a lowered incidence of endometrial hyperplasia. Morphological and biochemical studies of the endometrium suggest that 10 to 13 days of progestin are needed to provide maximal maturation of the endometrium and to eliminate any hyperplastic changes. Whether this will provide protection from endometrial carcinoma has not been clearly established. There are possible additional risks which may be associated with the inclusion of progestin in estrogen replacement regimens. (See PRECAUTIONS.) The choice of progestin and dosage may be important; product labeling should be reviewed to minimize possible adverse effects.

CONTRAINDICATIONS: Estrogens should not be used in women (or men) with any of the following conditions: 1. Known or suspected cancer of the breast except in appropriately selected patients being treated for metastatic disease. 2. Known or suspected estrogen-dependent neoplasia. 3. Known or suspected pregnancy (see Boxed Warning). 4. Undiagnosed abnormal genital bleeding. 5. Active thrombophlebitis or thromboembolic disorders. 6. A past history of thrombophlebitis, thrombosis, or thromboembolic disorders associated with previous estrogen use (except when used in treatment of breast or prostatic malignancy).

WARNINGS: Estrogens have been reported to increase the risk of endometrial carcinoma (see Boxed Warning). However, a recent large, case-controlled study indicated no increase in risk of breast cancer in postmenopausal women. A recent study has reported a 2- to 3-fold increase in the risk of surgically confirmed gallbladder disease in women receiving postmenopausal estrogens.

Adverse effects of oral contraceptives may be expected at the larger doses of estrogen used to treat prostatic or breast cancer or postpartum breast engorgement, it has been shown that there is an increased risk of thrombosis in men receiving estrogens for prostatic cancer and women for postpartum breast engorgement. Users of oral contraceptives have an increased risk of diseases, such as thrombophlebitis, pulmonary embolism, stroke, and myocardial infarction. Cases of retinal thrombosis, mesenteric thrombosis, and optic neuritis have been reported in oral contraceptive users. An increased risk of postsurgery thromboembolic complications has also been reported in users of oral contraceptives. If feasible, estrogen should be discontinued at least 4 weeks before surgery of the type associated with an increased risk of thromboembolism, or during periods of prolonged immobilization. Estrogens should not be used in persons with active thrombophlebitis, thromboembolic disorders, or in persons with a history of such disorders in association with estrogen use. They should be used with caution in patients with cerebral vascular or coronary artery disease. Large doses (5 mg conjugated estrogens per day), comparable to those used to treat cancer of the prostate and breast have been shown to increase the risk of nonfatal myocardial infarction, pulmonary embolism and thrombophlebitis. When doses of this size are used, any of the thromboembolic and thrombotic adverse effects should be considered a clear risk.

For atrophic vaginitis

PREMARIN® (conjugated estrogens)

Vaginal Cream
0.625 mg/g

Benign hepatic adenomas should be considered in estrogen users having abdominal pain and tenderness, abdominal mass, or hypovolemic shock. Hepatocellular carcinoma has been reported in women taking estrogen-containing oral contraceptives. Increased blood pressure may occur with use of estrogens in the menopause and blood pressure should be monitored with estrogen use. A worsening of glucose tolerance has been observed in patients on estrogen-containing oral contraceptives. For this reason, diabetic patients should be carefully observed. Estrogens may lead to severe hypercalcemia in patients with breast cancer and bone metastases.

PRECAUTIONS: Physical examination and a complete medical and family history should be taken prior to the initiation of any estrogen therapy with special reference to blood pressure, breasts, abdomen, and pelvic organs, and should include a Papanicolaou smear. As a general rule, estrogen should not be prescribed for longer than one year without another physical examination being performed. Conditions influenced by fluid retention, such as asthma, epilepsy, migraine, and cardiac or renal dysfunction, require careful observation. Certain patients may develop manifestations of excessive estrogenic stimulation, such as abnormal or excessive uterine bleeding, mastodynia, etc. Prolonged administration of unopposed estrogen therapy has been reported to increase the risk of endometrial hyperplasia in some patients. Oral contraceptives appear to be associated with an increased incidence of mental depression. Patients with a history of depression should be carefully observed. Pre-existing uterine leiomyomata may increase in size during estrogen use. The pathologist should be advised of estrogen therapy when relevant specimens are submitted. If jaundice develops in any patient receiving estrogen, the medication should be discontinued while the cause is investigated. Estrogens should be used with care in patients with impaired liver function, renal insufficiency, metabolic bone diseases associated with hypercalcemia, or in young patients in whom bone growth is not yet complete. If concomitant progestin therapy is used, potential risks may include adverse effects on carbohydrate and lipid metabolism.

The following changes may be expected with larger doses of estrogen:

- Increased sulfobromophthalen retention
- Increased prothrombin and factors VII, VIII, IX, and X, decreased antithrombin 3, increased norepinephrine-induced platelet aggregability
- Increased thyroid binding globulin (TBG) leading to increased circulating total thyroid hormone, as measured by PBI, T_3 by column, or T_4 by radioimmunoassay. Free T_3 resin uptake is decreased, reflecting the elevated TBG. Free T_4 concentration is unaltered.
- Impaired glucose tolerance
- Decreased pregnanediol excretion
- Reduced response to methylprednisolone test
- Reduced serum folate concentration
- Increased serum triglyceride and phospholipid concentration

As a general principle, the administration of any drug to nursing mothers should be done only when clearly necessary since many drugs are excreted in human milk.

Long-term, continuous administration of natural and synthetic estrogens in certain animal species increases the frequency of carcinomas of the breast, cervix, vagina, and liver. However, in a recent, large case-controlled study of postmenopausal women there was no increase in risk of breast cancer with use of conjugated estrogens.

ADVERSE REACTIONS: The following have been reported with estrogenic therapy including oral contraceptives, breakthrough bleeding, spotting, change in menstrual flow, dysmenorrhea, premenstrual-like syndrome, amenorrhea during and after treatment, increase in size of uterine fibromyoma, vaginal candidiasis, change in cervical erosion and in degree of cervical secretion, cystitis-like syndrome, tenderness, enlargement, secretion (of breasts), nausea, vomiting, abdominal cramps, bloating, cholestatic jaundice, chloasma or melasma which may persist when drug is discontinued, erythema multiforme, erythema nodosum, hemorrhagic eruption, loss of scalp hair, hirsutism, steepening of corneal curvature; intolerance to contact lenses; headache, migraine, dizziness, mental depression, chorea, increase or decrease in weight, reduced carbohydrate tolerance, aggravation of porphyria, edema, changes in libido.

ACUTE OVERDOSAGE: May cause nausea, and withdrawal bleeding may occur in females.

DOSEAGE AND ADMINISTRATION:

PREMARIN® Brand of conjugated estrogens tablets, USP

1. *Given cyclically for short-term use only.* For treatment of moderate-to-severe vasomotor symptoms, atrophic vaginitis, or kraurosis vulvae associated with the menopause (0.3 mg to 1.25 mg or more daily). The lowest dose that will control symptoms should be chosen and medication should be discontinued as promptly as possible. Administration should be cyclic (eg, three weeks on and one week off). Attempts to discontinue or taper medication should be made at three- to six-month intervals.

2. *Given cyclically.* Osteoporosis. Female castration. Osteoporosis — 0.625 mg daily. Administration should be cyclic (eg, three weeks on and one week off). Female castration — 1.25 mg daily, cyclically. Adjust upward or downward according to response of the patient. For maintenance, adjust dosage to lowest level that will provide effective control.

Patients with an intact uterus should be monitored for signs of endometrial cancer and appropriate measures taken to rule out malignancy in the event of persistent or recurring abnormal vaginal bleeding.

PREMARIN® Brand of conjugated estrogens Vaginal Cream

Given cyclically for short-term use only. For treatment of atrophic vaginitis or kraurosis vulvae.

The lowest dose that will control symptoms should be chosen and medication should be discontinued as promptly as possible.

Administration should be cyclic (eg, three weeks on and one week off).

Attempts to discontinue or taper medication should be made at three- to six-month intervals.

Usual dosage range: 2 g to 4 g daily, intravaginally, depending on the severity of the condition.

Treated patients with an intact uterus should be monitored closely for signs of endometrial cancer and appropriate diagnostic measures should be taken to rule out malignancy in the event of persistent or recurring abnormal vaginal bleeding.

Management of Malignant Tracheoesophageal Fistula Using a Celestin Tube

Mark R. Milunski, M.D.

Carcinoma of the esophagus is a particularly dreaded illness for many reasons. Its dismal five-year survival rate of approximately 6%, median survival of six months after diagnosis, and usual advanced state at the time of initial presentation, as well as the lack of adequate curative therapy, make this relatively rare cancer (approximately 1% of all cancers and 4% of all GI cancers) a devastating illness.^{1,2} In most cases, therapy is aimed at palliation of the disease.

This report discusses a frequent complication of esophageal cancer — tracheoesophageal fistula (TEF) — and how to manage it by non-surgical means. The following case is typical of this complication.

My patient is a 52-year-old white man who presented to his private physician with a one- to two-month complaint of dysphagia, initially with solids only but now with liquids as well. Liquids, once swallowed, promptly caused him to cough. He denied fever, chills, hemoptysis, or purulent sputum production. He also reported a 10-pound weight loss over the month prior to presentation as well as new onset of hoarseness. There was a history of heavy, ongoing cigarette smoking and a past history of heavy alcohol consumption. The past medical history is notable for coronary artery disease and valvular heart disease for which the patient underwent coronary artery bypass grafting and aortic valve replacement in 1985.

A barium esophagram revealed an esophageal tumor 5-6 cm in length with free flow of barium into the tracheo-bronchial tree through a TEF located about 5 cm above the carina. The patient was referred to the Veterans Administration Medical Center in Durham for further evaluation and treatment.

Physical examination revealed a thin man with clear lung fields and mechanical sounds from his prosthetic valve on auscultation. He was asked to swallow a sip of water, which he promptly coughed back up.

Esophagoscopy revealed an esophageal tumor occluding approximately 75% of the lumen. Biopsy of the tumor was diagnostic of squamous cell carcinoma. A modified Celestin silastic esophageal stent was placed, under endoscopic and fluoroscopic guidance, after the patient underwent esophageal dilation. Barium esophagram after the procedure confirmed the position of the stent and the occlusion of the TEF. The patient obtained immediate relief from his incessant coughing of aspirated oral secretions and was able to consume a soft diet on the day after the procedure.

The Problem . . . and a Solution

Tracheoesophageal fistula occurs in 5-10% of patients with cancer of the esophagus.³ TEF can also involve the bronchi and other pulmonary structures. With the diagnosis of TEF, the median survival plummets to approximately six weeks.³ Therefore, proper management is imperative; it can often improve the quality of life, and it can sometimes bring the survival time back up to six months simply by preventing the recurrent aspiration pneumonias which are often the cause of death in these patients.

Moreover, the unaided patient with a TEF is unable to take any nourishment by mouth, which leads to further debility. It is toward this end, improvement of the quality of life, that ways have been sought to overcome TEF and allow patients to consume at least a high-calorie liquid diet.

Various surgical procedures are available for bypassing a TEF. However, these are major procedures and carry a mortality of about 40%. Less invasive means of bypassing TEF have been developed, most of which involve placement of a silastic tube in the esophagus under endoscopic guidance. These tubes serve to both bypass the tumor stricture and occlude the TEF. Mortality from the procedure itself is much less than that from the more invasive bypass procedures.

The Celestin tube is inserted over a flexible fiberoptic gastroscope using the so-called "push-through" technique with topical anesthesia. Stent placement is not without haz-

From Cardiovascular Division, Washington University Medical Center, Box 8086, 660 South Euclid Avenue, St. Louis, MO 63110. At the time of writing this paper, Dr. Milunski was a Senior Resident in Medicine at Duke University Medical Center.

ard and should be done only by persons who have experience with the procedure. Esophageal perforation with massive bleeding and mediastinitis are infrequent but disastrous complications occurring in about 2% of patients.⁴ Dislodgement of the stent occurs in about 25% of patients.⁴ The prosthesis can migrate proximally, occluding the airway, or distally into the stomach, sometimes requiring surgical removal. Large pieces of food and tumor overgrowth can occlude the lumen of the stent as well. Stents should not be placed in the proximal esophagus since they can cause a foreign body sensation in the throat or occlude the glottis.

Placement of an esophageal stent often allows a patient to enjoy the taste of food once again without the hazards of aspiration, and can sometimes make an otherwise ineligible patient a candidate for palliative radiation therapy. ■

Intracranial Aneurysms

for the Primary Care Physician

Allan H. Friedman, M.D.

Intracranial aneurysms are generally considered to be rare lesions whose treatment lies firmly within the province of the neurosurgeon. In fact, intracranial aneurysms are a relatively common cause of stroke, and success in their treatment is firmly predicated upon early diagnosis by primary care physicians.

Subarachnoid hemorrhage is an increasingly important cause of stroke. Although the incidence of both ischemic infarction and hypertensive intracerebral hemorrhage has diminished over the past 30 years, the incidence of subarachnoid hemorrhage has remained constant at 12 per 100,000.¹ Thus approximately 28,000 Americans suffer a subarachnoid hemorrhage from a ruptured aneurysm each year.

The population in whom subarachnoid hemorrhage occurs is generally younger than that involved in ischemic infarction. While 75% of ischemic infarcts occur in patients who are age 65 or older, 75% of subarachnoid hemorrhages occur in patients who are less than 65. Thus, although ischemic stroke is usually associated with diffuse atherosclerotic vascular disease leaving survivors with a 45% chance of dying in the subsequent five years, and intracranial aneurysms are rarely associated with systemic disease, subarachnoid hemorrhage causing stroke can rob patients of more productive years than ischemic stroke.

The Role of the Primary Care Physician

In 25% of patients who suffer a subarachnoid hemorrhage, the presenting symptoms are overlooked or lead to an incorrect diagnosis.²⁻⁴ The patients who are most often overlooked are those who present with a headache but without a substantial concomitant neurological deficit. Since therapeutic intervention is aimed at preventing a second hem-

orrhage and cannot appreciably influence the neurological deficits acquired from the initial hemorrhage, it is those patients who present in good condition who are most likely to benefit from early diagnosis and treatment.

Incorrect diagnosis is the most important remediable cause for serious morbidity and mortality following the rupture of an intracranial aneurysm. The number of patients who return to the hospital dead or with a serious neurological deficit following an incorrect diagnosis far outnumber the morbidity and mortality associated with aneurysm surgery. Thus, subarachnoid hemorrhage is clearly the concern of the primary care physician.

Clinical Presentation

Berry aneurysms are thin-walled outpouchings that occur at the bifurcation of intracranial vessels. Most commonly, they occur at the base of the brain on or close to the circle of Willis. Rarely, intracranial aneurysms are discovered incidentally. Unruptured inadvertently discovered aneurysms greater than six millimeters in diameter rupture at a rate of 3% per year and should be surgically obliterated in patients who have a life expectancy of at least five years.^{5,6} Occasionally an aneurysm comes to clinical attention as an intracranial mass, but most often they present with subarachnoid hemorrhage.

Although the signs and symptoms of a severe subarachnoid hemorrhage are distinctive, the symptoms associated with a less severe hemorrhage may approximate those of other more common conditions. The patient who has suffered a subarachnoid hemorrhage complains of a severe

From Division of Neurosurgery, Department of Surgery, Duke University Medical Center, Durham 27710.

Table 1

Characteristics of headache following subarachnoid hemorrhage

- Severe — "worst headache of my life"
- Long lasting — often persists for days
- Abrupt onset — often brought on with exertion
- Novel distribution — "different from my usual headaches"

headache which is remarkable for its intensity. Frequently it is described as "the worst headache I have ever had in my life" (table 1). Occasionally the headache will crescendo over hours or even days but usually it is abrupt in onset. It is rarely described as throbbing.

Associated with the onset of the headache, there is a change in the patient's mental status. The severity of this mental alteration reflects the severity of the hemorrhage and ranges from momentary confusion to persistent coma. Many patients experience nausea. The conscious patient may complain of photophobia and nuchal rigidity. Rarely the patient will develop back and radicular leg pain as the blood pools in the lumbar subarachnoid space.

The emergency room physician and primary care physician are often frustrated because there is no sign or symptom that will invariably distinguish a headache secondary to a ruptured aneurysm from headaches of a more benign etiology. The clue to diagnosing subarachnoid hemorrhage is the unusual intensity and duration of the headache. Even a patient who chronically complains of headache will note that the headache associated with the subarachnoid hemorrhage will (1) occupy a novel distribution, (2) be of unusual intensity, (3) start with an unusually abrupt onset, and/or (4) last longer than the patient's usual headache.

One-third of patients who suffer a catastrophic hemorrhage are noted to have experienced a "warning leak" or small hemorrhage in the days prior.⁷ This "warning leak" is characterized by headache. Again, the headache is distinctive for its intensity, sudden onset, persistence and unusual location. The distribution of the headache does not help in reaching the correct diagnosis, as the headache may be hemicranial, bilateral, orbital or even facial in its distribution. Severe photophobia is unusual although mild nuchal rigidity may be present. It is important to know that the brain CT scan may be negative following a small subarachnoid hemorrhage but that the patient's spinal fluid will almost invariably be xanthochromic and demonstrate red blood cells.

Physical Examination

In some cases physical examination will aid in the diagnosis. In a few cases, the aneurysm itself or the hemorrhage from the aneurysm will act as an intracranial mass causing dysfunction of neighboring structures. Although third nerve

dysfunction (eyelid ptosis, pupillary enlargement and diplopia) is the most common example of neuronal dysfunction secondary to the mass effect of an aneurysm, rupture of the aneurysm into the brain parenchyma can result in hemiparesis, aphasia, etc. Subarachnoid hemorrhage can manifest as a change in mental status, nuchal rigidity or at least discomfort with neck flexion, and subhyaloid hemorrhage on examination of the ocular fundus. The patient's blood pressure is usually elevated.

Laboratory Tests

The diagnosis of a subarachnoid hemorrhage can usually be confirmed by a brain computed tomographic (CT) scan (figure 1). Although the resolution of the CT scanner will not delineate the average sized aneurysm, it will in the majority of cases demonstrate subarachnoid blood. Unfortunately, a negative brain CT scan will not completely rule out the possibility of a subarachnoid hemorrhage. In patients who have suffered a mild hemorrhage, the CT scanner may not have sufficient resolution to demonstrate the subarachnoid blood. In the days following the hemorrhage, the blood may mix with enough cerebrospinal fluid (CSF) to lose its characteristic high density and become isodense with the adjacent brain.

The diagnosis can almost always be made by an examination of the cerebrospinal fluid. Although there is a small risk of inducing further hemorrhage with this technique, the

Figure 1. White blood in subarachnoid space outlines darker neural structures.

Figure 2. Large aneurysm at bifurcation of internal carotid artery (arrow head) into middle (single arrow) and anterior (double arrow) cerebral arteries. Note the thinness of the vessels. This patient has vasospasm.

potential advantages clearly outweigh this very small risk. In the patient who has no neurological manifestation of an intracranial mass or elevated high intracranial pressure, a spinal tap can be performed with a very low complication rate.

Spontaneous subarachnoid hemorrhage may be differentiated from a traumatic spinal tap by examining the red blood cell count in successive CSF samples. Following a traumatic spinal tap, the red cell count will diminish after some of the CSF has been allowed to drain. One can often determine that a spinal tap was traumatic by counting red blood cells in the first and fifth collection tubes. The differentiation between a traumatic spinal tap and spontaneous subarachnoid hemorrhage can also be made by examining the supernatant of the CSF following centrifugation. If the patient has suffered a spontaneous subarachnoid hemorrhage, the supernatant will be xanthochromic. Because the xanthochromia reflects the degradation of red blood cells within the CSF, the degree of xanthochromia will depend on the extent of the hemorrhage and the length of time between the hemorrhage and the spinal tap. Once the diagnosis of subarachnoid hemorrhage is made, a cerebral angiogram must be performed to delineate the cause of the hemorrhage (figure 2).

Sequelae of a Ruptured Aneurysm

Once the aneurysm has hemorrhaged, the patient may suffer further loss of neurological function as a result of one of several sequelae. The four most common causes of neurological deficits are the initial hemorrhage, vasospasm, recurrent hemorrhage and hydrocephalus. Neurological def-

icits arising from the initial hemorrhage may be permanent or may slowly abate on their own as is the case in any form of stroke. Although the physician cannot resurrect dead neurons, he or she can be certain that the brain is not subjected to further metabolic insults, such as hypoxia or hypoglycemia, while it is healing. These insults will hinder the brain from achieving its maximal potential.

The most feared complication of a ruptured intracranial aneurysm is rebleeding. Twenty percent of patients will suffer a recurrent bleed within two weeks after the initial hemorrhage, and 50% of patients in whom the aneurysm is not obliterated surgically will suffer a second hemorrhage in the ensuing six months.^{8,9} Because the patients have all been weakened by the initial hemorrhage, these second hemorrhages are associated with a mortality of approximately 50%. Pharmacological prevention of rebleeding has been disappointing. Although the antifibrinolytic agent ϵ -aminocaproic acid will halve the rebleeding rate in the two weeks following the initial hemorrhage, patients treated with this agent seem to suffer a higher incidence of stroke.⁸ Thus as a net effect, the patient mortality over the two-week period is unchanged. Surgical obliteration of the aneurysm is the only sure method of preventing rebleeding.

The second major cause of morbidity and mortality is vasospasm. Vasospasm is defined as an idiopathic segmental narrowing of the large intracranial vessels. These contracted segments can be readily identified on an arteriogram. The clinical manifestations of vasospasm are the result of a cerebral ischemia and stroke. Approximately 50% of patients who have suffered a ruptured aneurysm will manifest vasospasm on an angiogram, and in 30% of patients vasospasm will result in a neurologic deficit. Occasionally the primary care physician will make the diagnosis of a ruptured aneurysm only after this neurological deficit from the vasospasm appears.

The exact etiology of vasospasm remains obscure. It has a delayed onset, most often beginning between the third and fourteenth day after the subarachnoid hemorrhage.^{10,11} Vasospasm rarely begins within three days of the subarachnoid hemorrhage. It is this delayed onset that is so perplexing. Despite the frequency and predictable course of this condition, no completely effective therapy has been identified. At present the best therapy for vasospasm is intravascular volume expansion and arterial hypertension.¹²

The third most important complication is hydrocephalus. Because the subarachnoid blood obstructs CSF pathways, most patients who suffer a ruptured aneurysm will initially have some hydrocephalus. A small number of patients will develop progressive unresolving normal pressure hydrocephalus manifest as confusion, gait difficulty and urinary incontinence.

Therapy¹³

The point of this article is that the first step in successfully

treating a ruptured aneurysm is prompt diagnosis of a subarachnoid hemorrhage. After identifying the hemorrhage, precautions are taken to avoid a sudden elevation in the patient's blood pressure which might rupture the aneurysm. The patient is kept at bedrest in a dimly lit, quiet room. Visitation is limited. The patient is given stool softeners to avoid constipation and sometimes a mild sedative that will suppress anxiety but not affect the patient's mental status. Precautions are taken to keep the confused patient from falling out of bed. Although rebleeding from the aneurysm can be reduced by the use of ϵ -aminocaproic acid, this agent does not reduce the overall mortality associated with the condition.

The definitive treatment for an intracranial aneurysm is surgical. Most frequently, at the time of surgery, the base of the aneurysm is separated from the vascular lumen with a metal clip. Technical advances in microsurgery over the past 20 years have greatly reduced the hazards associated with aneurysm surgery.

The timing of the surgical repair remains controversial. In the 1950s surgeons performed surgery as soon as the diagnosis of a ruptured aneurysm was made. The anesthetic techniques and surgical equipment available at that time left them poorly prepared to tackle an acutely ruptured aneurysm. They also noted delayed deterioration of their patients which we now know was secondary to vasospasm. In the late 1960s and 1970s most surgeons delayed surgery for at least ten days or until the vasospasm had passed. This regimen combined with technical advances led to a drastic decline in the operative morbidity and mortality.

Unfortunately, in a review of the total population who had suffered from ruptured intracranial aneurysm, it was found that many patients died prior to becoming surgical candidates. This led to the exploration of two further modifications in therapy. First, there is some preliminary data suggesting that calcium channel blocking agents, if begun soon after the subarachnoid hemorrhage, can mitigate the effects of vasospasm. This finding led to a cooperative investigation of the use of calcium channel blockers in the therapy of ruptured intracranial aneurysm. Second, newer technology has made it safer to operate on intracranial aneurysms soon after rupture. Now that we know that vasospasm

rarely occurs prior to the third day after the hemorrhage, many surgeons advocate operating on aneurysms within this three-day hiatus. ■

Charlotte, North Carolina 28211, (704) 541-8020

PHYSICIANS, SCHEDULE SOME TIME FOR YOUR COUNTRY.

Many physicians would like to devote some time to their country in a local Army Reserve unit. We know that making a weekend commitment can be difficult for most physicians. So it is practical for the Army Reserve units to be flexible about time. It's worth discussing.

Incidentally, in addition to satisfying your own desire to serve your country, there are exceptional opportunities to do something totally different from a day-to-day routine. Opportunities to study new areas of medicine, meet new people in your specialty, and be a part of one of the world's most advanced medical teams.

Discuss the opportunities with our Army Medical Personnel Counselor.

FOR SURGEONS LOOKING FOR A CHALLENGE.

Your challenge could be the Army Reserve unit near you. It's a unit that requires the services of surgeons.

You may wish to explore the challenge of teaching in a major medical center. You may wish to explore the special challenges of your specialty in triage. Certainly you'll be confronted by challenges very different from your daily routine.

You'll also have an opportunity to participate in a number of programs in which you'll be able to exchange views and information with other surgeons from all over the country.

The Army Reserve understands the time demands on a busy physician, so you can count on us to be totally flexible in making time for you to share your specialty with your country. We'll arrange your training program to work with your practice.

To find out about the benefits of serving with a nearby Army Reserve unit, we recommend you call our Army Medical Personnel Counselor.

PHYSICIANS, THERE ARE TWO KINDS OF FLEXIBILITY IN THE ARMY RESERVE WE THINK YOU'LL LIKE.

One, time. We know how tough it is for a busy physician to make weekend time commitments. So we offer flexible training programs that allow a physician to share some time with his or her country. We arrange a schedule to suit your requirements.

Two, the opportunity to explore other phases of medicine, to add a different kind of knowledge—the challenge of military health care. It's a flexibility which could prove to be both stimulating and rewarding, with the opportunity to participate in a variety of programs that can put you in contact with medical leaders from all over the country.

See how flexible we can be, call our Army Medical Personnel Counselor.

**ARMY RESERVE.
BE ALL YOU CAN BE.**

HERE'S ONE DOCTOR WHO WON'T PAY HIS MALPRACTICE PREMIUMS THIS YEAR.

The Army covers his premiums. Since he's an Army Physician, there are a lot of worries associated with private practice that he won't have to contend with. Like excessive paperwork, and the overhead costs incurred in running a private practice.

What he will get is a highly challenging, highly rewarding experience. The Army offers varied assignments, chances to specialize, or further your education, and to work with a team of dedicated health care professionals. Plus a generous benefits package.

If you're interested in practicing high quality health care with a minimum of administrative burdens, examine Army medicine. Talk to your local Army Medical Department Counselor for more information.

ANNOUNCING NEW

Keflet[®] TABLETS cephalexin

All the advantages of cephalexin in a convenient tablet form

- Backed by over 15 years of clinical experience
- Smaller tablet is specially shaped and coated for easier swallowing
- May enhance patient compliance, particularly among the elderly
- Tablet dosage form may be appreciated by patients of all ages

NEW Keflet Tablets are available as:

Keflet is contraindicated in patients with known allergy to the cephalosporins and should be given cautiously to penicillin-sensitive patients.

Brief Summary. Consult the package literature for prescribing information. Indications and Usage: Keflet[®] Tablets (cephalexin, Dista) are indicated for the treatment of the following infections when caused by susceptible strains of the designated microorganisms:

Respiratory tract infections caused by *Streptococcus pneumoniae* and group A β -hemolytic streptococci (Penicillin is the usual drug of choice in the treatment and prevention of streptococcal infections, including the prophylaxis of rheumatic fever. Keflet is generally effective in the eradication of streptococci from the nasopharynx; however, substantial data establishing the efficacy of Keflet in the subsequent prevention of rheumatic fever are not available at present.)

Otitis media due to *S. pneumoniae*, *Haemophilus influenzae*, staphylococci, streptococci, and *Neisseria catarrhalis*

Skin and skin structure infections caused by staphylococci and/or streptococci

Bone infections caused by staphylococci and/or *Proteus mirabilis*

Genitourinary tract infections, including acute prostatitis, caused by *Escherichia coli*, *P. mirabilis*, and *Klebsiella* sp.

Note:—Culture and susceptibility tests should be initiated prior to and during therapy. Renal function studies should be performed when indicated.

Contraindication: Keflet is contraindicated in patients with known allergy to the cephalosporin group of antibiotics.

Warnings: BEFORE CEPHALOSPORIN THERAPY IS INSTITUTED, CAREFUL INQUIRY SHOULD BE MADE CONCERNING PREVIOUS HYPERSENSITIVITY REACTIONS TO CEPHALOSPORINS AND PENICILLIN. CEPHALOSPORIN C DERIVATIVES SHOULD BE GIVEN CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS.

SERIOUS ACUTE HYPERSENSITIVITY REACTIONS MAY REQUIRE EPINEPHRINE AND OTHER EMERGENCY MEASURES.

There is some clinical and laboratory evidence of partial cross-allergenicity of the penicillins and the cephalosporins. Patients have been reported to have had severe reactions (including anaphylaxis) to both drugs.

Any patient who has demonstrated some form of allergy, particularly to drugs, should receive antibiotics cautiously. No exception should be made with regard to Keflet.

Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics (including macrolides, semisynthetic penicillins, and cephalosporins), therefore, it is important to consider its diagnosis in patients who develop diarrhea in association with the use of antibiotics. Such colitis may range in severity from mild to life-threatening.

Treatment with broad-spectrum antibiotics alters the normal flora of the colon and may permit overgrowth of clostridia. Studies indicate that a toxin produced by *Clostridium difficile* is one primary cause of antibiotic-associated colitis.

Mild cases of pseudomembranous colitis usually respond to drug discontinuance alone. In moderate to severe cases, management should include sigmoidoscopy, appropriate bacteriologic studies, and fluid, electrolyte, and protein supplementation. When the colitis does not improve after the drug has been discontinued, or when it is severe, oral vancomycin is the drug of choice for antibiotic-associated pseudomembranous colitis produced by *C. difficile*. Other causes of colitis should be ruled out.

Usage in Pregnancy:—Safety of this product for use during pregnancy has not been established.

Precautions: **General:**—Patients should be followed carefully so that any side effects or unusual manifestations of drug idiosyncrasy may be detected. If an allergic reaction to Keflet occurs, the drug should be discontinued and the patient treated with the usual agents (eg, epinephrine or other pressor amines, antihistamines, or corticosteroids).

Prolonged use of Keflet may result in the overgrowth of nonsusceptible organisms. Careful observation of the patient is essential. If superinfection occurs during therapy, appropriate measures should be taken.

Positive direct Coombs' tests have been reported during treatment with the cephalosporin antibiotics. In hematologic studies or in transfusion cross-matching procedures when antiglobulin tests are performed on the minor side or in Coombs' testing of newborns whose mothers have received cephalosporin antibiotics before parturition, it should be recognized that a positive Coombs' test may be due to the drug.

Keflet should be administered with caution in the presence of markedly impaired renal function. Under such conditions, careful clinical observation and laboratory studies should be made because safe dosage may be lower than that usually recommended.

Indicated surgical procedures should be performed in conjunction with antibiotic therapy.

As a result of administration of Keflet, a false-positive reaction for glucose in the urine may occur. This has been observed with Benedict's and Fehling's solutions and also with Clintest[®] tablets but not with Tes-Tape[®] (Glucose Enzymatic Test Strip, USP, Lilly).

Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.

Usage in Pregnancy—Pregnancy Category B:—The daily oral administration of cephalexin to rats in doses of 250 or 500 mg/kg prior to and during pregnancy or to rats and mice during the period of organogenesis only, had no adverse effect on fertility, fetal viability, fetal weight, or litter size. Note that the safety of cephalexin during pregnancy in humans has not been established.

Cephalexin showed no enhanced toxicity in weanling and newborn rats as compared with adult animals. Nevertheless, because the studies in humans cannot rule out the possibility of harm, Keflet should be used during pregnancy only if clearly needed.

Nursing Mothers:—The excretion of cephalexin in the milk increased up to 4 hours after a 500-mg dose, the drug reached a maximum level of 4 μ g/mL, then decreased gradually, and had disappeared 8 hours after administration. Caution should be exercised when Keflet is administered to a nursing woman.

Adverse Reactions: **Gastrointestinal:**—Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment. Nausea and vomiting have been reported rarely. The most frequent side effect has been diarrhea. It was very rarely severe enough to warrant cessation of therapy. Dyspepsia and abdominal pain have also occurred. As with some penicillins and some other cephalosporins, transient hepatitis and cholestatic jaundice have been reported rarely.

Hypersensitivity:—Allergic reactions in the form of rash, urticaria, angioedema, and, rarely, erythema multiforme, Stevens-Johnson Syndrome, or toxic epidermal necrolysis have been observed. These reactions usually subsided upon discontinuation of the drug. Anaphylaxis has also been reported.

Other reactions have included genital and anal pruritus, genital moniliasis, vaginitis and vaginal discharge, dizziness, fatigue, and headache. Reversible interstitial nephritis has been reported rarely. Eosinophilia, neutropenia, thrombocytopenia, and slight elevations in SGOT and SGPT have been reported.

ZOVIRAX[®]

(acyclovir)

CAPSULES

Prevent genital herpes
recurrences
month after month with
daily therapy.

(In controlled studies, recurrences were
totally prevented for 4 to 6 months in up to
75% of patients.)

Please see last page of this advertisement.

ZOVIRAX[®] **(acyclovir)** **CAPSULES**

**Help free your
patients from
recurrences.**

Daily therapy

Coping with genital herpes is rarely easy. For some, the worst part is the pain and discomfort of frequent attacks — month after month, year after year. For others, the emotional burden presents a more difficult problem, leading to social isolation, anxiety, and diminished self-esteem.

Prevent or reduce recurrences

Although your patients have to live with herpes, they shouldn't have to suffer. Daily therapy with ZOVIRAX CAPSULES can help free them from the cycle of recurrent genital herpes. For many, one capsule three times a day can suppress recurrences completely while on therapy.

Generally well tolerated

Daily therapy with ZOVIRAX CAPSULES is generally well tolerated. The most frequent adverse reactions reported during clinical trials were headache, diarrhea, nausea/vomiting, vertigo, and arthralgia.

The physical and emotional difficulties posed by genital herpes are unique for each patient. The frequency and severity of recurrent episodes, as well as the emotional impact of the disease, should be considered when selecting daily therapy with ZOVIRAX CAPSULES.

*Please see brief summary of
prescribing information on next page.*

Prevent recurrences month after month*

ZOVIRAX®

(acyclovir) CAPSULES

Brief Summary

INDICATIONS AND USAGE: Zovirax Capsules are indicated for the treatment of initial episodes and the management of recurrent episodes of genital herpes in certain patients.

The severity of disease is variable depending upon the immune status of the patient, the frequency and duration of episodes, and the degree of cutaneous or systemic involvement. These factors should determine patient management, which may include symptomatic support and counseling only, or the institution of specific therapy. The physical, emotional and psycho-social difficulties posed by herpes infections as well as the degree of debilitation, particularly in immunocompromised patients, are unique for each patient, and the physician should determine therapeutic alternatives based on his or her understanding of the individual patient's needs. Thus Zovirax Capsules are not appropriate in treating all genital herpes infections. The following guidelines may be useful in weighing the benefit/risk considerations in specific disease categories:

First Episodes (primary and nonprimary infections — commonly known as initial genital herpes):

Double-blind, placebo-controlled studies have demonstrated that orally administered Zovirax significantly reduced the duration of acute infection (detection of virus in lesions by tissue culture) and lesion healing. The duration of pain and new lesion formation was decreased in some patient groups. The promptness of initiation of therapy and/or the patient's prior exposure to Herpes simplex virus may influence the degree of benefit from therapy. Patients with mild disease may derive less benefit than those with more severe episodes. In patients with extremely severe episodes, in which prostration, central nervous system involvement, urinary retention or inability to take oral medication require hospitalization and more aggressive management, therapy may be best initiated with intravenous Zovirax.

Recurrent Episodes:

Double-blind, placebo-controlled studies in patients with frequent recurrences (6 or more episodes per year) have shown that Zovirax Capsules given for 4 to 6 months prevented or reduced the frequency and/or severity of recurrences in greater than 95% of patients. Clinical recurrences were prevented in 40 to 75% of patients. Some patients experienced increased severity of the first episode following cessation of therapy; the severity of subsequent episodes and the effect on the natural history of the disease are still under study.

The safety and efficacy of orally administered acyclovir in the suppression of frequent episodes of genital herpes have been established only for up to 6 months. Chronic suppressive therapy is most appropriate when, in the judgement of the physician, the benefits of such a regimen outweigh known or potential adverse effects. In general, Zovirax Capsules should not be used for the suppression of recurrent disease in mildly affected patients. Unanswered questions concerning the human relevance of *in vitro* mutagenicity studies and reproductive toxicity studies in animals given very high doses of acyclovir for short periods (see Carcinogenesis, Mutagenesis, Impairment of Fertility) should be borne in mind when designing long-term management for individual patients. Discussion of these issues with patients will provide them the opportunity to weigh the potential for toxicity against the severity of their disease. Thus, this regimen should be considered only for appropriate patients and only for six months until the results of ongoing studies allow a more precise evaluation of the benefit/risk assessment of prolonged therapy.

Limited studies have shown that there are certain patients for whom intermittent short-term treatment of recurrent episodes is effective. This approach may be more appropriate than a suppressive regimen in patients with infrequent recurrences.

Immunocompromised patients with recurrent herpes infections can be treated with either intermittent or chronic suppressive therapy. Clinically significant resistance, although rare, is more likely to be seen with prolonged or repeated therapy in severely immunocompromised patients with active lesions.

CONTRAINDICATIONS: Zovirax Capsules are contraindicated for patients who develop hypersensitivity or intolerance to the components of the formulation.

WARNINGS: Zovirax Capsules are intended for oral ingestion only.

PRECAUTIONS: General: Zovirax has caused decreased spermatogenesis at high doses in some animals and mutagenesis in some acute studies at high concentrations of drug (see PRECAUTIONS — Carcinogenesis, Mutagenesis, Impairment of Fertility). The recommended dosage and length of treatment should not be exceeded (see DOSAGE AND ADMINISTRATION).

Exposure of Herpes simplex isolates to acyclovir *in vitro* can lead to the emergence of less sensitive viruses. The possibility of the appearance of less sensitive viruses in man must be borne in mind when treating patients. The relationship between the *in vitro* sensitivity of Herpes simplex virus to acyclovir and clinical response to therapy has yet to be established.

Because of the possibility that less sensitive virus may be selected in patients who are receiving acyclovir, all patients should be advised to take particular care to avoid potential transmission of virus if active lesions are present while they are on therapy. In severely immunocompromised patients, the physician should be aware that prolonged or repeated courses of acyclovir may result in selection of resistant viruses which may not fully respond to continued acyclovir therapy.

Drug Interactions: Co-administration of probenecid with intravenous acyclovir has been shown to increase the mean half-life and the area under the concentration-time curve. Urinary excretion and renal clearance were correspondingly reduced.

Carcinogenesis, Mutagenesis, Impairment of Fertility: Acyclovir was tested in lifetime bioassays in rats and mice at single daily doses of 50, 150 and 450 mg/kg given by gavage. There was no statistically significant difference in the incidence of tumors between treated and control animals, nor did acyclovir shorten the latency of tumors. In 2 *in vitro* cell transformation assays, used to provide preliminary assessment of potential oncogenicity in advance of these more definitive life-time bioassays in rodents, conflicting results were obtained. Acyclovir was positive at the highest dose used in one system and the resulting morphologically transformed cells formed tumors when inoculated into immunosuppressed, syngeneic, weanling mice. Acyclovir was negative in another transformation system considered less sensitive.

In acute studies, there was an increase, not statistically significant, in the incidence of chromosomal damage at maximum tolerated parenteral doses of 100 mg/kg acyclovir in rats but not Chinese hamsters; higher doses of 500 and 1000 mg/kg were clastogenic in Chinese hamsters. In addition, no activity was found after 5 days dosing in a dominant lethal study in mice. In 6 of 11 microbial and mammalian cell assays, no evidence of mutagenicity was observed. At 3 loci in a Chinese hamster ovary cell line, the results were inconclusive. In 2 mammalian cell assays (human lymphocytes and L5178Y mouse lymphoma cells *in vitro*), positive responses for mutagenicity and chromosomal damage occurred, but only at concentrations at least 400 times the acyclovir plasma levels achieved in man.

Acyclovir has not been shown to impair fertility or reproduction in mice (450 mg/kg/day, p.o.) or in rats (25 mg/kg/day, s.c.). At 50 mg/kg/day s.c. in the rat, there was a statistically significant increase in post-implantation loss, but no concomitant decrease in litter size. In female rabbits treated subcutaneously with acyclovir subsequent to mating, there was a statistically significant decrease in implantation efficiency but no concomitant decrease in litter size at a dose of 50 mg/kg/day. No effect upon implantation efficiency was observed when the same dose was administered intravenously. In a rat peri- and postnatal study at 50 mg/kg/day s.c., there was a statistically significant decrease in the group mean numbers of corpora lutea, total implantation sites and live fetuses in the F₁ generation. Although not statistically significant, there was also a dose related decrease in group mean numbers of live fetuses and implantation sites at 12.5 mg/kg/day and 25 mg/kg/day, s.c. The intravenous administration of 100 mg/kg/day, a dose known to cause obstructive nephropathy in rabbits, caused a significant increase in fetal resorptions and a corresponding decrease in litter size. However, at a

maximum tolerated intravenous dose of 50 mg/kg/day in rabbits, there were no drug-related reproductive effects.

Intraperitoneal doses of 320 or 80 mg/kg/day acyclovir given to rats for 1 and 6 months, respectively, caused testicular atrophy. Testicular atrophy was persistent through the 4-week postdose recovery phase after 320 mg/kg/day; some evidence of recovery of sperm production was evident 30 days post-dose. Intravenous doses of 100 and 200 mg/kg/day acyclovir given to dogs for 31 days caused aspermato-genesis. Testicles were normal in dogs given 50 mg/kg/day, i.v. for one month.

Pregnancy: Teratogenic Effects: Pregnancy Category C. Acyclovir was not teratogenic in the mouse (450 mg/kg/day, p.o.), rat (50 mg/kg/day, s.c.) or rabbit (50 mg/kg/day, s.c. and i.v.). There are no adequate and well-controlled studies in pregnant women. Acyclovir should not be used during pregnancy unless the potential benefit justifies the potential risk to the fetus. Although acyclovir was not teratogenic in animal studies, the drug's potential for causing chromosome breaks at high concentration should be taken into consideration in making this determination.

Nursing Mothers: It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when Zovirax is administered to a nursing woman. In nursing mothers, consideration should be given to not using acyclovir treatment or discontinuing breastfeeding.

Pediatric Use: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS — Short-Term Administration: The most frequent adverse reactions reported during clinical trials were nausea and/or vomiting in 8 of 298 patient treatments (2.7%) and headache in 2 of 298 (0.6%). Less frequent adverse reactions, each of which occurred in 1 of 298 patient treatments (0.3%), included diarrhea, dizziness, anorexia, fatigue, edema, skin rash, leg pain, inguinal adenopathy, medication taste and sore throat.

Long-Term Administration: The most frequent adverse reactions reported in studies of daily therapy for 3 to 6 months were headache in 33 of 251 patients (13.1%), diarrhea in 22 of 251 (8.8%), nausea and/or vomiting in 20 of 251 (8.0%), vertigo in 9 of 251 (3.6%), and arthralgia in 9 of 251 (3.6%). Less frequent adverse reactions, each of which occurred in less than 3% of the 251 patients (see number of patients in parentheses), included skin rash (7), insomnia (4), fatigue (7), fever (4), palpitations (1), sore throat (2), superficial thrombophlebitis (1), muscle cramps (2), paronychia (1), menstrual abnormality (4), acne (3), lymphadenopathy (2), irritability (1), accelerated hair loss (1), and depression (1).

DOSAGE AND ADMINISTRATION: Treatment of initial genital herpes: One 200 mg capsule every 4 hours, while awake, for a total of 5 capsules daily for 10 days (total 50 capsules).

Chronic suppressive therapy for recurrent disease: One 200 mg capsule 3 times daily for up to 6 months. Some patients may require more drug, up to one 200 mg capsule 5 times daily for up to 6 months.

Intermittent Therapy: One 200 mg capsule every 4 hours, while awake, for a total of 5 capsules daily for 5 days (total 25 capsules). Therapy should be initiated at the earliest sign or symptom (prodrome) of recurrence.

Patients With Acute or Chronic Renal Impairment: One 200 mg capsule every 12 hours is recommended for patients with creatinine clearance ≤ 10 ml/min/1.73 m².

HOW SUPPLIED: Zovirax Capsules (blue, opaque) containing 200 mg acyclovir and printed with "Wellcome ZOVIRAX 200" — Bottles of 100 (NDC-0081-0991-55) and unit dose pack of 100 (NDC-0081-0991-56).

Store at 15°-30°C (59°-86°F) and protect from light.

*In controlled studies, recurrences were totally prevented for 4 to 6 months in up to 75% of patients.

BURROUGHS-WELLCOME CO.

Fever with a Dissecting Aorta Aneurysm

A Case Report and Review of the Literature

Bruce Gould, M.D., and Ralph Corey, M.D.

“There is no disease more conducive to clinical humility than aneurysm of the aorta.” (William Osler¹)

Despite the great strides in our diagnostic capabilities, Dr. Osler's words still hold true today. The protean manifestations of dissecting aortic aneurysms make the diagnosis an elusive one. One of the less common symptoms, fever, can lead to an extensive and unproductive workup.

We report a case of fever of unknown origin secondary to a chronically dissecting aortic aneurysm, and review six previous cases. A recognition of this association may be helpful in the workup of patients with either of these problems.

A 79-year-old white woman with a one-year history of mild hypertension presented with the sudden onset of intense back pain radiating to the left precordium. She described the pain as “a firecracker going off in my chest.” Examination showed a blood pressure of 180/90 mmHg in her right arm. A myocardial infarction was ruled out by serial enzymes and electrocardiograms. However, the patient was found to have daily temperature spikes of more than 102°F. Leukocyte counts ran between 8000/mm³ and 11,000/mm³ with normal differentials. A sedimentation rate was 79 mm/hr. Blood, urine, and sputum cultures were negative for bacteria and tuberculosis. A ventilation-perfusion scan and echocardiogram were unrevealing.

During the patient's hospitalization she developed epigastric pain. Liver enzymes, amylase, upper and lower barium studies, biliary studies, and an abdominal CT scan were normal. Computer tomography of the chest showed an aortic dissection distal to the left subclavian artery which her physicians felt was quiescent. She was also found to have an unexplained drop in her hematocrit from 40% to 32%. After 13 days in the hospital the patient was discharged with the cause of her fever, anemia, and chest pain unexplained.

Six weeks later the patient was rehospitalized with re-

current tearing chest pain and fever. Physical examination showed her to be chronically ill with a temperature to 101.6°F. No pulmonary or cardiovascular abnormalities were found on physical examination. The hematocrit remained at 32% and the sedimentation was 75 mm/hr. Leukocyte counts ranged from 10,000/mm³ to 13,000/mm³. A chest x-ray showed a small left pleural effusion and a thoracic aneurysm; the effusion was not tapped. Cultures of blood and urine were negative as was a gallium scan. During the seven days before transfer, the patient had daily temperature spikes as high as 102.5°F.

On arrival at Duke University Medical Center the patient appeared tired but in no distress. Her blood pressure was 170/80 mmHg in both arms; her temperature was 99.5°F. Her chest was tender to palpation over the left lateral wall. Cardiorespiratory and abdominal examination were entirely normal. Femoral and distal pulses were weak but equal. Laboratory studies showed a hematocrit of 34%; leukocyte count of 13,000/mm³ (73% neutrophils, 1% bands, 21% lymphocytes, and 5% monocytes). The chest x-ray showed dilation of the thoracic aorta. Blood and urine cultures were negative. Rib detail x-rays and a bone scan were normal. A chest CT scan showed a type 3 dissecting aneurysm which had enlarged since the previous study six weeks earlier (figure 1). Surgical repair was offered to the patient, but she favored conservative therapy with a beta-blocker and careful follow-up. Over the four months since discharge, the patient has remained afebrile and pain-free.

Discussion

In retrospect, our patient's tearing back pain is a classic description of a dissecting aneurysm, and the location of the pain in the back suggests a type 3 aneurysm. She appeared to have had two acute episodes of dissection. In light

Department of Medicine, Duke University Medical Center, Durham 27710.

Table 1

	Age/Sex	Clinical Features	Maximum Temp (F)	Initial Diagnosis	Fever Duration	Aneurysm Type	Time to Diagnosis
Case 1 ³	68M	nausea, vomiting hypotension	102.0°	rule out abdominal disease	5 weeks	type 2	5 weeks
Case 2 ³	27M	severe back pain Marfan's syndrome	104.0°	dissecting aneurysm, fever of unknown origin	11 weeks	type 3	3 days
Case 3 ³	33M	substernal chest pain, dyspnea, aortic insufficiency	103.0°	bacterial endocarditis	3 days	type 2	3 days
Case 4 ³	37M	substernal chest pain, diaphoresis, aortic insufficiency	102.0°	bacterial endocarditis	2 weeks	type 2	2 weeks
Case 5 ⁴	50M	intense substernal chest pain, malaise, holosystolic murmur	102.5°	fever of unknown origin	5 weeks	type 2	2 weeks
Case 6 ⁵	51M	sharp anterior chest pain, dyspnea, aortic insufficiency	102.0°	bacterial endocarditis	4 weeks	type 2	4 weeks
Case 7	79F	intense back and left chest pain, epigastric pain	102.5°	fever of unknown origin	9 weeks	type 3	8 weeks

of the negative gastrointestinal workup, the patient's abdominal complaints were very likely due to referred pain as the aneurysm dissected toward the abdomen. The drop in the patient's hematocrit can be attributed to the accumulation of blood in the aortic wall. Because of the little appreciated association between prolonged fever and dissecting aortic aneurysms the initial investigators were misled.

Hirst² reviewed 505 cases of dissecting aneurysms reported from 1933 to 1954. He found the presence of a fever greater than 100.1°F in a third of the cases. Additionally, 8% had temperatures greater than 102°F. Despite this review the association of fever and dissecting aortic aneurysms has received little attention in the major textbooks. In the recent literature six other case reports have documented the occurrence of fever with dissecting aortic aneurysms.³⁻⁵ These cases have usually occurred in a clinical setting suggestive of an aneurysm but in which the chest x-rays were not

remarkable. Bacterial endocarditis was initially diagnosed in three cases because of the presence of fever and an aortic regurgitation murmur. All three of these patients, however, had severe chest pain which is uncommon in endocarditis. In the other three cases an extensive and unrevealing fever workup was undertaken. In three of six cases, the diagnosis was not made until the chest x-ray findings showed mediastinal widening. A fourth case was diagnosed by the development of physical findings and a fifth was discovered at valve surgery. The maximum temperature in these cases was 104°F with a mean temperature of 102.5°F.

In addition to high fevers, dissecting aneurysms can be associated with prolonged fevers which can last up to 11 weeks. The longest-lasting fevers occurred in the patient with the largest aneurysm. The aneurysm in Case Two extended from the left subclavian to the iliac arteries. Whether the prolonged fevers are a manifestation of an extensive dissection or of smaller, recurrent dissections is difficult to say. We felt the latter was true in our case.

One postulated mechanism of temperature elevation in these patients is the presence of an intramural hematoma. The association of hematomas and fever has been recorded in the literature. In a series of 105 patients with fever of unknown origin, Larson⁶ found resolution of three patients' fevers with removal of cryptogenic hematomas. Clarke⁷ and Staheli⁸ found high fevers in pediatric patients who suffered fractures complicated only by hematomas. Clarke took the observation one step further and injected blood into the quadriceps of the donor rabbits. The rabbits with a hematoma had a significantly higher temperature than the rabbits injected with lactated Ringer's solution. The fevers were thought to be generated by the release of the pyrogen, interleukin I, from the macrophage,⁹⁻¹¹ a cell important in

Figure 1. Computerized tomography with contrast of dissecting descending thoracic aortic aneurysm.

hematoma reabsorption.¹² The pyrogen then acts on the preoptic region of the hypothalamus to initiate a fever.¹³

Mackowiak⁴ postulated that the proximal location of the dissection in his case predisposed to the development of fever. His contention was that high concentrations of pyrogen were carried directly to the central nervous system leading to the development of high fevers. While this may be true, our case and Case Two illustrate that a dissection proximal to the great vessels is not a prerequisite for the development of high fevers. Further, in the cases associated with type two dissections, hemorrhagic pericarditis may add to the fever.

As these cases illustrate, when a patient presents with fever and chest pain a dissecting thoracic aneurysm must be considered. The key to diagnosis is a high index of suspicion and careful examination of the patient and the chest x-ray. Further evaluation with chest CT scan or an aortogram should be carried out early so that appropriate therapy can be instituted. Awareness of the association of fever and dissecting aortic aneurysms may help in the diagnosis of an often elusive disease. ■

Acknowledgments

The authors wish to thank Dr. David Mason and Dr. Ronald Digbee for their help in the clinical care of this patient.

Oy Oy Oy — My Back

An Unusual Cause of Back Pain Secondary to Adult Gaucher's Disease

Peter Mark Levitin, M.D., F.A.C.P.

Although most patients with low back pain have regional disease, occasionally a patient has a systemic disease that presents as back pain.^{1,2}

A 58-year-old woman had a two-year history of intermittent lower thoracic and lumbar back pain associated with progressive kyphosis and loss of height (5 inches). The back pain was initially precipitated by lifting firewood. One year after her initial symptoms, a physician told her she had traumatic vertebral compression fractures.

Examination revealed a small female who could not sit or stand straight up because of the severe thoracic kyphosis. There was pain on palpation of the right and left paralumbar muscles. The peripheral joints were normal except for Heberden and Bouchard nodes and limited active abduction of the left shoulder due to an old traumatic humeral fracture. The abdomen could not be adequately examined because of the severe kyphosis.

Laboratory test results included a hemoglobin of 11.9 gm/dl, white blood cell count of 3800/mm³ with a normal differential and an erythrocyte sedimentation rate (Westergren) of 25 mm/hour. Results of chemistry screens, serum and urine immunoelectrophoresis were normal.

Radiologic examination of the lumbosacral spine revealed compression fractures of T11, L1, L2, and L4. Figure 1 demonstrates L1, L2, and L4 compression fractures.

A bone marrow aspirate and biopsy were performed and showed Gaucher cells (figure 2; next page). (This procedure was initially done to look for evidence of multiple myeloma or other malignancy.) A white blood cell assay for the enzyme B-glucocerebrosidase was low (18% of control). Subsequent laboratory studies included a platelet count of 92,000/mm³ and an acid phosphatase of 1.4 IU/L (normal 0.0-0.8 IU/L). A left hip radiograph was normal and a liver/spleen scan demonstrated splenomegaly.

Figure 1. Radiograph of the lateral lumbar spine demonstrating vertebral compression fractures of L1, L2, and L4.

Discussion

Adult Gaucher's disease (type I) is characterized by the abnormal accumulation of glucocerebroside in the reticuloendothelial cells of the spleen, bone marrow, and other

From A.J. Tannenbaum Medical Associates, 1904 North Church Street, Greensboro 27405.

Figure 2. Bone marrow aspirate demonstrating a Gaucher cell. The cytoplasm appears crinkled and has a tissue paper appearance characteristic of Gaucher cells.

organs due to a deficiency of the lysosomal enzyme B-glucocerebrosidase. The adult form of Gaucher's disease, although panethnic, is more common in Ashkenazic Jews, occurs equally in men and women, and can become clinically evident at any age.^{3,4}

The skeletal manifestations of adult Gaucher's disease can include a variety of clinical presentations (table 1).³⁻¹⁰ Single or multiple vertebral compression fractures, especially in the thoracolumbar spine, can cause low back pain and may result in severe kyphosis.³⁻⁸ Compression fractures in Gaucher's disease result from the accumulation of Gaucher cells in the medullary space of the bone marrow that may lead to increased intramedullary pressure, disintegration and atrophy of the bone trabeculae, and to thinning and erosion of the cortex.⁹

There is no specific treatment for Gaucher's disease. In some cases, bone pain has responded to radiation therapy

Table 1

Skeletal Involvement in Gaucher's Disease

1. Bone pain syndromes
 - a. nonspecific bone pain
 - b. pseudo-osteomyelitis
 - c. pyogenic osteomyelitis
2. Aseptic necrosis of subchondral bone (hip > shoulder, knee) joint pain and/or joint destruction with restricted movement.
3. Erlenmeyer flask deformity of the distal femur
4. Vertebral compression fractures
5. Pathologic fractures of long bones
6. Interphalangeal joint involvement
7. Migratory polyarthritis
8. Hemorrhagic bursitis

or corticosteroids. Enzyme replacement with B-glucocerebrosidase is being studied.^{4,6-8}

Gaucher's disease is rarely encountered as a cause of low back pain in clinical practice. This case serves as a reminder that compression fractures can be due to many causes other than idiopathic osteoporosis. ■

How To Get Help from the Creatinine Clearance *and* the Plasma Creatinine Concentration

William B. Blythe, M.D.

It is my conviction, derived from conversations with some of our house officers and information sent to me by several referring physicians, that there is confusion about the use and relative merit of the plasma creatinine concentration and the creatinine clearance as markers of renal function.

There is, I believe, a widespread notion that the creatinine clearance is *always* more precise a measure of the status of renal function than is the plasma creatinine concentration. This is not true! Let me point out why.

The only measure of glomerular filtration rate in humans which has remained unsullied through the years is the clearance of inulin. This determination is too time-consuming to be of use to the clinician. This being the case, a search was initiated to find a substance the clearance of which approximates that of inulin, the production of which occurs in the body so that it does not have to be administered, and the measurement of which is relatively simple.

Almost half a century ago creatinine was found to fit the bill reasonably well in that it is easily measured and its rate of production by the body is constant under most circumstances; however, it was found early on that the creatinine clearance is not always identical to the inulin clearance.

As a result of extensive use of the endogenous creatinine clearance through the years, these questions have arisen: Which chemical determination of creatinine results in an endogenous creatinine clearance which is closest to the inulin clearance? What are the circumstances in which the endogenous creatinine clearance might differ so much from the inulin clearance that it could not be used as a measure of glomerular filtration rate? Can the plasma creatinine concentration be used as an accurate estimate of glomerular filtration rate?

The most widely-held view is that methods of measuring the sum of true creatinine *and* the so-called non-creatinine chromogens in plasma result in values for the endogenous creatinine clearance which most closely approximate the

inulin clearance. This is so because the non-creatinine chromogens are not excreted into the urine and their concentration in plasma offsets the small amount of creatinine secreted by the tubules. When true creatinine alone is measured in plasma, the value for creatinine clearance is falsely high. Many laboratories nowadays measure true creatinine and the clinician may be unaware of this fact.

Regardless of the method used, the creatinine/inulin clearance ratio increases as the glomerular filtration rate is reduced by disease until the glomerular filtration rate is at extremely low levels when the ratio returns toward one.

Lastly, what about the use of the plasma creatinine concentration per se as an accurate estimate of glomerular filtration rate?

In general, the evidence suggests that the relationship between plasma creatinine concentration and glomerular filtration rate is an inverse one; thus decreases in glomerular filtration are reflected in corresponding increases in plasma creatinine concentration. But remember, this is true only when creatinine production is constant. Furthermore, since creatinine production is a function of lean body mass, and since lean body mass varies from individual to individual, the plasma creatinine concentration cannot be used by itself as a measure of glomerular filtration rate.

Nevertheless, once the creatinine clearance is known, the plasma creatinine concentration *alone* can be used as a measure of glomerular filtration rate because of its inverse relationship to the creatinine clearance.

So what does this mean to you, the careful clinician? It means that you should be aware of these pitfalls, and specifically:

- 1 You should know the method of determining plasma creatinine that is used by your laboratory.
- 2 In determining a 24-hour creatinine clearance, you should be certain that the 24-hour collection of urine is accurate. You can do this by checking the amount of creatinine in the 24-hour collection. It should approximate 20 mgm of creatinine per kilogram of body weight per 24 hours. If it

is significantly less than this, you can be certain that the collection is inadequate and the creatinine clearance will be spuriously low. If it is significantly higher, the patient has collected urine for more than 24 hours and the creatinine clearance will be spuriously high.

3 Once you have determined an accurate creatinine clearance, you need not repeat it in following a patient. A plasma creatinine concentration is accurate.

One final word of caution: several groups of investigators have found that the relationship between plasma creatinine concentration and the endogenous creatinine clearance may not always be a truly inverse one and thus changes in the plasma creatinine concentration may not be reflective of changes in the glomerular filtration rate. Thus, as is always the case, the clinician must not rely on any number for a final answer. ■

B & B X R A Y

AND BENNETT X-RAY EQUIPMENT GO THE DISTANCE... FOR OPTIMUM MAMMOGRAPHY IMAGING

The Bennett M-3000-DCF Mammography System GOES THE DISTANCE with a 76 centimeter focal film distance. By comparison, a long focal film distance for mammography clearly produces sharper diagnostic images than a short focal film distance. And, the patient entry radiation exposure is considerably reduced. The Bennett M-3000-DCF Mammography System, coupled with low dose film/screen techniques, can provide optimum quality images with as little as 1/50th the radiation required by conventional x-ray equipment and direct exposure methods of only a few years ago.

The Bennett M-3000-DCF Mammography System is a simple to operate, low cost, yet truly sophisticated dedicated mammography x-ray unit. B & B X-Ray, Inc. offers the system with a 5-year warranty on parts and an optional 3-year warranty on the tube. Just another reason why B & B X-Ray, Inc. and Bennett X-Ray Equipment is the winning combination for optimum quality radiographs.

Breast Cancer Awareness Program

Asking Men To Help Fight Breast Cancer

American Academy of Family Physicians

To increase the chances of early detection of breast cancer, a disease that kills an estimated 40,000 women per year, Susan Ford Vance, spokesperson for the 1987 National Breast Cancer Awareness Week program, is appealing to men for help. Ms. Vance's campaign seeks to increase awareness among women and their partners about breast cancer and early detection techniques.*

One of the key elements of the program, sponsored by the American Academy of Family Physicians (AAFP), the National Cancer Care Foundation and the ICI Pharmaceuticals Group, is "A Partner's Guide to Breast Cancer Early Detection."

Male Guidelines

The "Partner's Guide" is being distributed to family physicians across the country to help them counsel men. It

emphasizes that mammography is the single most effective tool in the early detection of breast cancer and suggests ways for men to communicate this and other information about the disease to their loved ones.

Robert H. Taylor, M.D., president of the American Academy of Family Physicians, feels that while we have always talked to women, not men, about breast cancer, "if breast cancer strikes your wife, your mother, or your sister it has a significant impact. Men need to be informed about the importance of early detection so they can help support the women in their lives."

Family physicians nationwide are encouraged to discuss this information with their women patients' spouses and family members as well as with their male patients. A free booklet for men and women, titled "Breast Cancer: Your Best Protection . . . Early Detection," is available from The National Cancer Care foundation (attention: Diane Blum), 1180 Avenue of the Americas, New York, NY 10036 and also through members of the Academy of Family Physicians. The booklet was funded by the ICI Pharmaceuticals Group.

The "Partner's Guide" is divided into information and action guidelines (see the next page for the short version). The information guidelines — "What You Should Know" — cite breast self-examination and annual physician exam as important early detection techniques.

*See also the For Patients section of our October issue (NCMJ 1987;48:517-22) for a discussion of early detection techniques and the American Cancer Society's guide to breast self examination.

From AAFP, 1740 West 92nd Street, Kansas City, MO 64114.

What You Should Know:

- To date, breast cancer can't be prevented — early detection through appropriate mammography gives your wife or partner the best chance of survival.
- Breast self-examination — the easiest step in fighting breast cancer is detection awareness for women over 20, and appropriate mammography for women over 35.
- If she finds a lump, don't panic — not all lumps are cancerous.

What You Can Do:

- Talk to her about the importance of mammography — a vital, painless, early detection tool.
- Encourage her to see her family physician.
- Support your wife or partner — but don't pressure her.

The action guidelines — “What You Can Do” — suggest ways to encourage one's wife or partner to incorporate early detection methods into her daily routine. The guidelines recommend talking to her about the importance of mammography and encouraging her to schedule an appointment with her family physician. The guidelines also advise men to do something as simple as bringing newspaper and magazine articles about breast cancer to their partner's attention.

Disease of the breast is a very serious matter to women, and should be approached in a straightforward manner. As Dr. Taylor says, “It will tell her a lot about how much you care to bring up the matter in a gentle, delicate, and concerned manner. And you just might help to save her life.”

Survey Results

In a recent telephone survey on male attitudes about breast cancer, conducted for the ICI Pharmaceuticals Group, less than one-third of the 500 men interviewed had discussed mammography with their wives or partners, and less than half had discussed breast cancer or breast self-examination.

The survey also found that close to six in 10 men thought their partners regularly examined their breasts. This figure is much higher than a recent Gallup study finding that only one in three women regularly performed self-examination.

The ICI survey also reported that half the men questioned said their partners did not have mammograms based on the schedule recommended by the American Cancer Society.

“It's very common for women to be the health caretakers of the entire family,” says Diane Blum, director of Social Service at the National Cancer Care foundation, and founder of the National Alliance of Breast Cancer

Organizations (NABCO). “By asking men to become part of the health prevention loop, we are attempting to break the molds of some very traditional roles.”

Cancer Research

The ICI Pharmaceuticals Group is comprised of Stuart Pharmaceuticals and the newly created ICI Pharma. ICI Pharma will now direct cancer research and development efforts for the Group. Stuart Pharmaceuticals will share its cancer knowledge and advances spanning the past 20 years with ICI Pharma.

Stuart Pharmaceuticals founded National Breast Cancer Awareness Week in 1985 to generate awareness of breast cancer early detection in women. Stuart's extensive breast cancer research includes the development of tamoxifen, a widely used breast cancer hormonal treatment.

Recent Breast Cancer Findings

In the last nine months, significant findings have been reported in the field of breast cancer. Statistics from the National Cancer Institute (NCI), for example, show black women may be at higher risk than non-black women for developing breast cancer between the ages of 20 and 40. Also, an American Cancer Society survey of black women found they have a lower incidence of recognizing the early warning signs of breast cancer.

In May, the *New England Journal of Medicine* published an article reporting that moderate drinking — about three drinks a week — can increase a woman's risk of breast cancer by 50%. Within the last few years, 15 studies have linked alcohol to breast cancer.

In March, the American Cancer Society updated its

mammography guidelines. It now recommends women 35-40 have a baseline mammogram, women 40-49 have mammograms every one to two years, and women over the age of 50 have a breast X-ray yearly.

In April, a U.S. Preventive Services Task Force study published in the *Journal of the American Medical Association* conceded that not enough research has been done to determine the effectiveness of breast self-examination.

Women should continue to examine their breasts for signs of cancer, but this should not be the only detection method they employ.

The American Cancer Society estimates 130,000 new cases of breast cancer will be diagnosed this year. About one in 10 women will develop the disease at some time during her life. Breast cancer will claim over 41,000 lives this year. ■

Unique Boutique
Pamper Your Femininity

After Breast Surgery Consultants

If you have had breast surgery, we would like to invite you to the shop that specializes in servicing all of the needs of the mastectomee. We carry a variety of breast forms and bras that enable us to provide a custom fit specifically for each individual. We also have accessory items helpful during stages of reconstruction or after lumpectomy surgery. In a cozy intimate shop with a relaxed environment, you will receive service and understanding from women who have shared your experience.

Health Care, Social Justice and the Elderly

LARRY R. CHURCHILL, Ph.D.

American health care is full of striking contrasts. We spent \$250,000 to keep Barney Clark alive, tethered to an air pump, for 112 days of "encumbered twilight" in Salt Lake City. Meanwhile, in cities like Detroit, Boston and Raleigh the infant mortality rate, frequently related to basic nutritional and perinatal care, has begun to rise. So far the federal government has contributed over \$240 million to develop the artificial heart, while at the same time cutting the programs which provide for the needs of indigent mothers and infants.

With the advent of cyclosporins, many large medical centers are now preparing their facilities to offer heart, liver and other organ transplant services, at a cost of hundreds of thousands of dollars per procedure. Simultaneously, large public hospitals in some Southern states are closing their emergency rooms on weekends in order to stem the flow of poor patients who use emergency rooms for primary care.

Persons in chronic vegetative states sometimes have their kidneys and bowels washed, their lungs cleared and their infections treated at public expense. While some seem to live needlessly, others seem to die needlessly. Eugene Barnes, a 32-year-old unemployed stab-wound victim, died in a San Francisco hospital in February, 1985. He was turned away from four other hospitals because he lacked health insurance. Do these scenarios present moral problems? It all depends on your view of justice, on what criteria you believe should be used to distribute health care resources.

These are not isolated instances. The larger picture looks roughly like this:

1 In 1986: We spend (estimated) \$450 billion on health care, or over \$1,800 for every citizen. This constitutes almost 11% of the Gross National Budget. Health care

costs have been rising at twice the rate of inflation over the last decade.

2 All Americans do not share the benefits of our health system equally. Numerous studies reveal roughly the same picture: the poor, the nonwhite, the elderly, those in urban ghettos or remote rural areas are in much worse health and receive far fewer benefits. At least 25 million Americans have no health insurance of any kind for all of any given year, while an additional 12 million are uninsured for a part of the year.

3 Pressures on our health care system will grow more acute for several reasons. The population is aging. By the year 2040 almost a quarter of us will be 65 or older. Currently 80% of our health resources are spent on chronic illness, and with the rising age of the population, this percentage is bound to increase. A third pressure on our diminishing resources is the high cost of technology.

In sum, we are faced with an increasingly aged, chronically ill population that is infatuated with high technology medicine. Distributional problems are, therefore, very likely to get worse.

When resources are limited, when health care must be rationed, questions about *fair* distribution arise. Such questions are not primarily issues of individual morality, but larger social concerns — concerns of *justice*.

There are inequities in all health care systems, and I take it for granted that there is no perfect system. The question is: Are the inequities in the current American system unfair, or merely unfortunate?

To put it more starkly, no society has figured out how to avoid rationing its health care resources. The question is not *will* we have to ration, but what rationing criteria will provide for the most just system of health care?

John Wax of the VA Hospital of Palo Alto has listed 18 ways to ration health care:

- 1 Ability to pay
- 2 Age
- 3 Residence
- 4 Entitlement
- 5 Need
- 6 Anticipated clinical outcome — effectiveness
- 7 Political contact
- 8 Acceptability as a research subject
- 9 Lottery
- 10 First come, first served

From Department of Social and Administrative Medicine, University of North Carolina School of Medicine, Chapel Hill 27514. This speech was delivered at the 133rd Annual Session of the North Carolina Medical Society, May 2, 1987. A more detailed form of some of these arguments can be found in the author's *Rationing Health Care in America*, University of Notre Dame Press, 1987.

- 11 Social worth
- 12 Moral or religious worth
- 13 Dread factor of the illness
- 14 Public or media pressure
- 15 Power of relevant specialty groups to command resources
- 16 Attractiveness to screeners
- 17 Risk of death or serious illness or injury if treatment is not forthcoming
- 18 Risk of legal or financial liability if treatment is withheld

Although we could find examples for each of Wax's 18 ways, the basic mode in the U.S. is *rationing by price*. Access to health care is mostly contingent on having a way to pay for it, usually by a third party. Some secondary criteria we use are *age* (Medicare), *race* (Indian Health Service), *merit* (veterans), geography, good looks, etc., but the overriding token of entrance is ability to pay. The genius of this system is that it hides responsibility. Price rationing fits snugly with a market economy and a consumer mentality; it is an extension of a basic economic philosophy we believe in deeply in this country. Since no one actually excludes the poor (it is their lack of money and insurance that excludes them, not our actions), no one is responsible and no one is to blame. Therefore efforts to assist the poor are seen as acts of charity, examples of a virtue seen as an option. The genius of laissez-faire health care is that it orders the priorities of health care by not ordering them, that is, by letting market forces decide who gets what.

And, of course, we don't follow the market consistently, because we are unwilling to let the poor die in the streets — if we can identify them with names and faces. For identified desperately ill, we have church barbecues, fund raisers and Air Force jets.

The Federal Task Force on Organ Transplantation (1986) recommended we end this *ad hoc* approach by covering all organ transplants with public funds, which sounds good, but would put us in the ironic situation of absolute equity in exotic, very expensive and partially effective forms of care while ignoring equity in some of the most effective and least expensive forms of care.

Four different ways have been proposed as distributional schemes: merit, social worth, ability to pay, and need. I will examine each briefly. There are assets and liabilities associated with each.

Merit

People should get health care if they deserve it. This sounds attractive because we find that a large number of deaths and disabilities occur each year due to causes not beyond our control: alcohol and automobile accidents; smoking and lung cancer; multiple sexual partners and venereal disease; and so on. In many instances people

have an effect on, and a responsibility for, their own medical needs.

Yet, there are problems with merit as the basis of allocation of medical care. *First*, because what is underscored here may be less a basis for distribution than a cry for prevention. *Second*, because the causal nexus which relates behavior to ill health is not so neat or clear as it first appears. Many now believe the causes of disease are multiple, not singular. *Third*, because many physicians find it impossible to say, for example, "I can't care for your lung cancer because you smoke."

The emphasis on meritorious behavior also may tend to exaggerate the extent to which health behaviors — for example, immoderate drinking — are truly voluntary. Merit as a criterion may tend to "blame the victim."

Some moral philosophers who reject merit as *the basis* of allocation argue for a merit clause in the system of payments. Robert Veatch, for example, asserts that although persons who smoke, drink, and hang-glide have an equal right to health care, they should be taxed for these voluntary risks to their health. Because they are more likely to use health care resources, such persons should be taxed at a rate calculated to add to the health budget an amount equal to the marginal health cost of their behavior.

The idea is attractive, but not persuasive. In order to show a just system of merit, Veatch needs to show that not only do certain behaviors add to the expense of health care, but the additional expense is greater than the costs of the alternatives.

A heavy smoker may die prematurely at age 50, incurring treatment costs for pulmonary disease of \$50,000, but this may well be less than the alternative scenario of death at age 85, preceded by coronary artery by-pass surgery, multiple hospitalizations and five years of care in an obtunded or severely debilitated condition in a custodial care institution. It is not clear, simply from the economic viewpoint, that *early death* is a greater drain on resources. In fact, I suspect that just the reverse argument is more cogent, that premature, sudden death is the great economizer and that a just system — considered strictly on what costs we are likely to incur — should tax those whose health habits are likely to propel them into advanced old age, where, as we know, they will use inordinate amounts of resources during their last year of life. If we follow this logic we should give a health-tax rebate to those who join sky-diving or hang-gliding clubs!

Additionally, the notion of a merit-based tax system for health care would be contingent on an effective way to determine who was practicing what. An even-handed treatment for all such practices raises the spectre of a *health police*, which violates cherished notions of privacy and liberty. It is unclear that a merit system could be made workable, and even if it were, whether we would want it.

Social Worth

Here priority is given to the social interest, the common good, the welfare of the community, or the greatest good for the greatest number. People should get health care if they are worthwhile or valuable citizens.

On the face of it this sounds reasonable — the most valuable members of society should receive top priority. The president should be the top priority in the emergency room. When Nancy Reagan wants the Mayo surgeons at Bethesda for the President, she should have them, even if this means that others in Rochester will have their surgery postponed or done by others.

But what seems easy enough in unusual cases is exceedingly problematic as more ordinary people are involved. We know from the scenarios surrounding access to renal dialysis in the 1960s how problematic social worth judgments can be. Universal entitlement to treatment for all with ESRD enacted in 1972 did not solve this problem, but put it on a different plane. The cost of the ESRD program is about \$3 billion annually, and will be an estimated \$6 billion by the early 1990s.

The difficulties of rationing on the basis of social worth are great, but universal coverage seems to add even more burdens to the system.

Ability to Pay

Here the idea is that people should get health care if they can pay for it. Some who argue for ability to pay argue for it in terms of physicians' right to have control over their practices. This is essentially the argument of Robert Sade, who in a well-known article, "The Right to Health Care: A Refutation," disavows patients' rights to care in favor of physicians' rights of liberty and autonomy over service. The physician owns her services like the baker owns his bread, and she can sell it for whatever price the market will bear, discount it, or give it away. This appeals to powerful American traditions of liberty and the values of the market, what Dan Beauchamp calls "market justice." Now I believe there are problems with this libertarian view of health marketing and with the Lockean model of professional ownership, but I do not want to argue it here. Because to argue this way, either for or against, presupposes just the sort of individualized ethic which is unproductive in discerning matters of justice. I want to approach the issue by asking, "How is it that we understand differences in health status, and differences in the need for services, to begin with?"

Market justice says disparities in wealth can translate into disparities of health care, and this is unfortunate, but not unfair. It is not unfair, the argument goes, because we all have different natural predispositions to disease, what is sometimes called "the natural lottery." And no one is responsible for the natural lottery. It isn't a social

injustice that some are born wealthy, some poor, some sickly, some healthy. The natural lottery is morally neutral. So if some can buy cosmetic rhinoplasty or mammary augmentation while others cannot afford basic prenatal care, it is regrettable, but not unjust.

Those who disagree argue that the structure of social life frequently exacerbates, and sometimes even causes, differences in the natural lottery. Fifty years ago Henry Sigerist claimed "the chief cause of disease is poverty." Research on the relationship of race, class, poverty and health consistently shows the same pattern. Economic and social conditions play a role not only in health care but in overall health. Some are in ill health because they are poor; some are poor because they are in ill health. Most researchers assume that the effects of poor health and low socioeconomic status are circular. Whatever the precise relationship, it is sufficiently clear that class differences contribute to the etiology of disease, so that disease is not just a natural component of the human genetic lottery, or a chance and uncontrollable occurrence.

If all diseases can be attributed to original patterns in the genetic pool rather than to our historical existence in social patterns, then obligations to alter or be responsive to these differential patterns of illness might be optional and gratuitous responses of charity. If class has nothing to do with disease and health, we can say that inequities in access to health care are unfortunate, but not unfair. But this is not the case.

Not all our health problems relate to social conditions, but, more than it is comfortable to think about, many of them do. Sometimes the unfairness results precisely from our participation in the social nexus which contributed to those differences, both medical and financial. The natural lottery turns out to be not so natural as it appeared.

Need

The guiding concept here is that people should get health care if they *need* it. Ordinarily this is discussed in terms of a "right" to health care and this has taken two forms: (1) that there is a right to *equal access* to whatever health care is available; or (2) that there is a right to a *decent minimum* of health care. Both forms seek to meet needs regardless of ability to pay, merit, or social worth.

The arguments go like this:

1 First, we must recognize that we all fall ill and are susceptible to disability and death.

2 Secondly, while some illnesses are self-induced, diseases generally are not the sorts of things which are distributed by merit. We all are very likely to incur needs for health care for which we are not responsible and which are, in many instances, unforeseeable.

3 Third, the need for health care is sometimes exacerbated, sometimes caused, by the social and cultural forces in society.

4 Finally, health care — largely as treatment by physicians, frequently as public health or preventive measures — is effective.

Ill health is, in sum, the sort of thing which is universally experienced, but unevenly distributed, over which we have little control or predictive power, and for which there is frequently effective help. A just society is one in which the right to health care is based on the elemental fact of human need.

And this is where most discussions stop. But to say there is a right to health care based on need is clearly insufficient. Everybody's needs are different, and it isn't clear whose definition of need (the physician's? the patient's? the Surgeon General's?) should be the standard. Also, in a consumer society we tend to express not only our true necessities but our hopes, wishes and preferences as "needs."

Any claim of a right to health care will have to recognize that there are limits to what society can provide for its citizens. No right is absolute, and the scope of a right to health care, like all rights, is contingent upon the material resources any society can muster. A right to health care is not a right to health, which, of course, no one can guarantee. A right to health care is not even a right to all that is available, or all that any of us may need. Health care competes for resources with a vast array of other social goods — education, defense, and housing, to mention only a few. A right to health care is, however, an aegis to protect the financially disenfranchised and a way of expressing equality. It means that citizens will not be

denied health care because of money, and that though we must ration health care, we will not do so by price.

I suggest that what we need is a working notion of a right to health care, that sees health care problems as public and social, rather than as purely private and individual; that sees health care as an agenda of the body politic, without the need to politicize every end-of-life scenario through wars on disease, or Air Force jets flying children in rescue missions for quarter-million-dollar transplants. This will require an outlook that sees health care as important, but not absolute, that is realistic about our health needs and prudent about the extent to which health care institutions and providers can meet them.

With regard to the elderly, a right to health care means that we should not discriminate against the elderly merely because of age. Yet this does not mean that age is irrelevant. To use age as a barrier to health care would be as unsatisfactory as using social worth, merit or ability to pay.

But having said this, we should be clear that age is relevant to health care needs, and cannot be ignored. In some cases it may simply be inefficient and ineffective to offer major high-technology interventions to the very old. And in all cases the needs of the elderly cannot be treated as a separable and isolated item, but must be seen in the context of the relative needs of everyone. Such a perspective will be seen as discriminatory only by those who believe that the health needs of the elderly always take priority. Prudent and realistic policies will treat the needs of the elderly — as well as the needs of all citizens — in a context that respects their special (and often greater) need for services, but does not separate them from the larger commons. ■

"If I Grow Up..."

Every child likes to play "grown-up", but no child should have to suffer the very grown-up symptoms of childhood cancer.

At St. Jude Children's Research Hospital, we're fighting to put an end to this senseless loss, and we're working toward a day when no innocent "grown-up" will lose her life to cancer.

To find out how you can help, write to St. Jude, 505 N. Parkway, Memphis, TN 38105, or call 1-800-238-9100.

Rehabilitation

S.J. PELLIGRA, M.D.

Rehabilitation is a concept that is becoming increasingly familiar to the public and the medical profession. However, the word is not without ambiguity. Old buildings are rehabilitated, as are persons with drug and alcohol addictions. When referring to facilities for the treatment of physically disabled persons, one generally uses the term "comprehensive rehabilitation center."

North Carolina is fortunate in having nine comprehensive treatment centers for persons with physical disabilities located throughout the state: in Asheville, Chapel Hill, Charlotte, Durham, Fayetteville, Greensboro, Greenville, Hickory, and Winston-Salem. Comprehensive inpatient rehabilitation is covered by most third-party payors, including Medicare and Medicaid. Care is provided on an inpatient basis when intensive care is required and when a patient has multiple problems. Each center maintains relatively similar admission criteria, based on national standards. The Moses H. Cone Rehabilitation Center (Greensboro) is a 49-bed inpatient facility with full outpatient and home health services. The Center is designed and constructed to serve patients whose physical rehabilitation needs exceed the scope of services generally offered in an acute hospital setting. Patients who have functional limitations are admitted with the goal of achieving as much independence as possible.

Conditions typically treated in rehabilitation centers include spinal cord and brain injury, as well as stroke and other neurological conditions. In addition, many orthopedic and rheumatological problems are also routinely managed. These may include major joint fractures, amputations, joint replacements, and disabling arthritis.

In the comprehensive rehabilitation setting, care is provided through an interdisciplinary team approach. It is important that the word "interdisciplinary," rather than "multidisciplinary," be used; the former implies a close relationship among the various treatment team members. The rehabilitation team is an efficient melding of highly skilled specialists who work together in achieving realistic goals. These team members may include the physician,

rehabilitation nurse, physical therapist, occupational therapist, speech therapist, recreational therapist, vocational counselor, psychologist, social worker, and dietician. Under certain circumstances, there are additional contributors to a patient's care: for example, a prosthetist (a person who makes artificial limbs) when the patient is an amputee.

During a person's rehabilitation center admission, various issues are addressed. These include problems with communication, self-care, mobility, homemaking, and bowel/bladder management; cognitive/perceptual disorders; safety awareness; caretaker education and training; community reintegration; and health maintenance. Team members are trained to treat certain functional problems with enough overlap for maximum effectiveness and efficiency.

The physician who specializes in physical medicine and rehabilitation, known as a physiatrist, provides a vital service, a service that responds both to the increasing recognition that society is responsible for its disabled members and to the increasing scope and sophistication of rehabilitative techniques. Physical medicine and rehabilitation involves diagnostic services and comprehensive treatment and care for patients who suffer from neuromuscular, musculoskeletal, and vascular disorders, and from the medical, psychological, social, and vocational disruptions that such physical problems bring. The physiatrist must be competent in a broad and varied spectrum of skills and have a sensitive appreciation of the patient and his or her family, friends, work, and recreational activities. A four-year residency training program prepares the physical medicine and rehabilitation physician to effectively direct the treatment team and manage the medical complications.

The History of Rehabilitation

When physical medicine and rehabilitation was given formal recognition as a medical specialty in 1947, with the establishment of the American Board of Physical Medicine and Rehabilitation, comprehensive rehabilitation was not taught or practiced in the United States. At that time,

From Moses H. Cone Memorial Hospital, 1200 North Elm Street, Greensboro 27401-1020.

only a few years had elapsed since Dr. Howard A. Rusk had demonstrated to the army that rehabilitation, rather than convalescence, was essential to restore soldiers to fitness for return to duty. Although the benefits of early ambulation were striking, physicians were still focusing almost exclusively on identification and eradication of acute pathology. Dr. Rusk began to refer to rehabilitation as "the third phase of medical care" to be instituted following the first phase, preventive medicine, and the second phase, curative medicine and surgery.

When rehabilitation was applied in this way, it represented a great stride forward. However, only a small minority of chronically disabled patients received rehabilitation as a part of medical management. All too frequently, patients experienced further deterioration during a stage of inactive convalescence. In the mid 1950s, the office of Vocational Rehabilitation reported that the average interval from onset of stroke to the referral for rehabilitation services was four years. Compare that to experience today where the average time for completion of the rehabilitation program after onset of stroke is less than two months.

As Dr. Rusk was quoted, "Rehabilitation of the chronically ill and disabled is not just a series of restorative techniques, it is a philosophy of medical responsibility. Failure to assume this responsibility means to guarantee the continued deterioration of many less-severely disabled persons until they too reach the severely disabled and totally dependent category. The neglect of disability in its early stages is far more costly than an early aggressive program of rehabilitation which will restore the individual to optimal self-sufficiency and functional performance."

The Future of Rehabilitation

The challenge facing the rehabilitation community today is to provide a better quality of life for disabled persons during a time of severe fiscal restraint. In reality, fiscal restraint should provide an opportunity to change the centuries-old tradition of offering disabled people a hand-out, and to adopt instead the concept of providing a hand-up. This is a period of time in which resources should be allocated in favor of rehabilitation. In North Carolina, this is indeed taking place. There are now some outstanding facilities for rehabilitation treatment, in addition to a wide array of services.

Over the last fifty years, medicine and surgery have prevented the deaths of countless persons who were critically ill. Many have been cured. However, there also has been an increasing number left with chronic disability. These disabled persons have higher costs for maintenance, in addition to the cost of required medical care, because of the continued disability. Dependency con-

sumes resources without enhancing productivity or quality of life for the patient. The development of rehabilitation as an integral part of comprehensive medical care, and its use in restoring function to persons with continuing impairments, will increase the efficiency of health care. The reduction of dependency through rehabilitation is cost effective.

It is sometimes possible to remove a disability although the disease, or impairment, remains. This simply illustrates that there is no one-to-one relationship between a disease and the residual disability. Disability can be removed even though the disease is unchanged. In rehabilitation programs, residual strengths are evaluated and built upon to "work around impairment" in order to remove disability.

It is important that we each become aware of the licensed and qualified comprehensive rehabilitation programs available in our communities. Through appropriate referral and treatment, we can help patients to achieve major improvements in quality of life. ■

This space contributed as a public service.

CANCER. IT'S SIMPLY NOT WHAT IT USED TO BE.

Over the last 40 years, research programs supported by the American Cancer Society have made increasing progress in the treatment, detection and prevention of cancer.

In 1986 alone, the Society funded over 700 projects conducted by the most distinguished scientists and research institutions in the country.

Which is why, this year, hundreds of thousands of people will be successfully treated for the disease.

We are winning.

But we need you to help keep it that way.

Help us keep winning.

TELL YOUR PATIENTS THEIR CHOLESTEROL NUMBER... BEFORE THEY ASK.

Reducing high blood cholesterol reduces the risk of heart disease. That's why we're telling Americans—through a national public service advertising campaign—to know their cholesterol number. Your patients may soon be asking you for their number and what it means.

And when they do, we can help. The National Cholesterol Education Program, administered by the National Heart, Lung, and Blood Institute, has developed adult treatment guidelines to help you identify high-risk patients and use the appropriate diet and/or drug therapy for those with elevated cholesterol levels.

Help your patients reduce their risk of heart disease. For a free copy of the *Report of the Expert Panel on Detection, Evaluation, and Treatment of High Blood Cholesterol in Adults*, complete the form below.

Lady Killer

Many young women feel smoking is stylish. It is not. Smoking is deadly.
If you could quit for just one day, you could kick the habit for life.

Please join the Great American Smokeout November 19.
Call your local American Cancer Society for more information.

Great American Smokeout/Nov. 19

DO YOU SOMETIMES FEEL THAT YOUR PRACTICE IS RUNNING YOU? DO YOU FEEL INTIMIDATED BY THIRD PARTIES? ARE YOU CONCERNED ABOUT YOUR LEVEL OF PROFIT? ARE YOU LOOKING FOR WAYS TO BOOST PRODUCTIVITY?

You, as a physician, need not be told that the practice of medicine is undergoing some marked changes due to many factors, not the least of which are increasing competition and the encroachment of government and other third parties into the delivery of health care. In addition to the above concerns, consider these also:

- Are your expenses too far out of line with your gross (over 55-60%)?
- Do costs appear to be out of control, and you can't figure out why?
- Do you have a low (below 93-95%) collection rate, and do you have trouble making firm financial arrangements with your patients?
- Is your practice unstable or showing difficulty in getting patients to return?
- Are you losing out to the competition in your community?

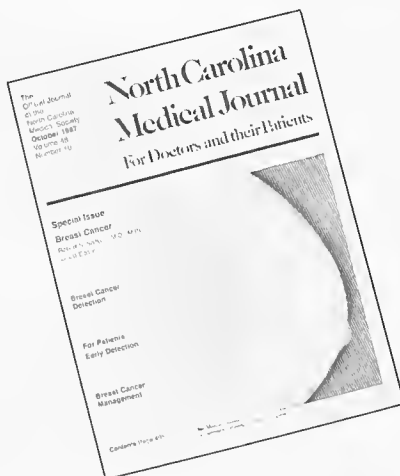

If you are having difficulties crystallizing your practice goals, or lack the technical expertise to solve any of the above problems, you need the objective, informed viewpoint of a practice management consultant. There is one company with 27 years of continuous service to physicians in North Carolina that provides a total scope of practice management including a **free** initial consultation of one hour and **guaranteed, pay-later** practice analysis. Director — Billy R. Tucker, C.P.B.C. — Best known name in medical practice consulting in the Southeast. Call us collect for additional information . . . (919) 454-5132.

TUCKER ENTERPRISES, INC. — complete practice analysis.
KEYSTONE MANAGEMENT SERVICES, INC. — total continuing practice management.
CPT COMPANY, INC. — procedural and diagnostic coding studies

Decant the Wine, Prune Back Your Long-Term Hopes

Cationic Detergent Poisoning

Ronald B. Mack, M.D.

I was in my favorite bookstore a while back and saw a volume entitled "Odes of Horace." It looked to me, at first glance, like a misprint. Could they have meant the "Nodes of Horace"? And who was this dude Horace anyway, whose lymphatic system entitled him to an entire book. Actually the book was entitled the "Odes of Horace";¹ I am not a lymphomaniac.

It turns out that Horace was a famous Roman poet who died eight years before Christ was born. This well educated son of an auctioneer served as a high-ranking officer in Brutus's Army (yes, that Brutus, as in "you too, Brutus?"). He fought in the famous battle of Phillipi but, alas, was on the losing side and lost all of his property. However, he was seen by the great literary patron Maecenas as a potentially great poet. Horace was so grateful to his financial backer that he was buried at his patron's side (he was dead at the time, of course). This short, fat versifier was very famous in his own time and has remained so through two millennia. My favorite ode of his (an ode apparently is a poem written to be sung and is expressive of the personal feeling of the person voicing it) speaks to the brevity of life and the urgent need to seize the day (*carpe diem*) while you can. Although Horace did not warn against the ingestion of cationic detergents, he should have.

For the first half of this century if you wanted to keep your clothes and yourself and your possessions clean, you used a soap substance. This soap was a salt of a fatty acid, made by combination of an alkali with natural fats or oils or with fatty acids from animal or vegetable sources (gosh, I always wondered what that stuff was made of that my Mom used to wash out my mouth with when I uttered a "dirty" word. Thank goodness today there aren't any dirty words anymore; any child merely has to turn on the TV day or night and hear a litany of words that once were cause for near-capital punishment in many homes). Now you are able to choose from a remarkable variety of cleansing agents

that includes *detergents*, non-soap surface active agents, which allow water to "wet" surfaces far more readily and thus produce a cleaner surface.

As with many technological advances in this part of the 20th Century there is a price to pay for "progress." Because detergents are so ubiquitous in the American home, they are a common cause of toxicological events, especially by pre-school ingesters. In some recently reported statistical data from the American Association of Poison Control Centers National Data Collecting Systems, regarding potentially toxic ingestions by children six years or less, pharmaceuticals led the way with 40% of the total, and cleaners and polishing agents were next with 14% of the total.² The surface-acting agents (surfactants) used in the home are mixtures of organic and inorganic ingredients and are classified chemically as anionic, cationic, non-ionic and amphoteric. The electrical charge of the chemical entity that makes the molecule water soluble determines the ionic classification. Thus the net charge on anionic detergents is negative, on cationic detergents positive, on non-ionic detergents electric neutrality, and on amphoteric detergents both anionic and cationic. Most household detergents are anionic or non-ionic or a mixture of both. This epistle will only concern itself with the *cationic* variety, also available in the home, but less often.

Cationic surfactant detergents have more potential toxicity than anionic or non-ionic detergents. This article was prompted by a two-year-old child we saw recently at our Medical Center who incurred oral, pharyngeal and esophageal burns after accidentally ingesting such a substance. I'm sure glad that stuff was not available when I was coming up, my Mom would have used it for sure — on me.

The reasons that cationic detergents were chosen for this dissertation is that they are potentially quite dangerous and readily available as disinfectants and fabric softeners. Included in the rubric, cationic surfactants, are three major chemical groups³ with which health care professionals should be familiar: quaternary ammonium compounds; pyridinium compounds; and quinolinium compounds. Examples are

From Department of Pediatrics, Bowman Gray School of Medicine, Wake Forest University, Winston-Salem 27103.

benzalkonium chloride (Zephiran^(R) Chloride), methylbenzethonium chloride (Diaparene^(R) Chloride) and cetylpyridinium chloride (Ceepryn^(R) Chloride). These products are synthetic derivatives of ammonium chloride. For anyone involved in managing patients who get into trouble with these products, the reading of labels becomes of utmost importance in attempting to figure out the potential toxicity. At the outset, the point must be made that these products are available in different strengths, i.e., the *concentrated* solutions (>7.5%) may result in significant corrosive burns of the oropharynx and esophagus, whereas the more dilute solutions can cause marked tissue irritation.⁴ Thus this potential toxin can produce both local and systemic adverse effects.

Clinical toxicity caused by cationic detergents depends, of course, on such variables as the type of surfactant involved, the amount of the chemical, the tissue that is being attacked, the age of the patient, the duration of the exposure, the concentration of the substance and so on. The eyes seem to be an area that can be interfaced with cationic detergents, at times with terrible consequences. For instance, whereas one drop of 0.1% solution of benzalkonium (Zephiran) can cause mild irritation of corneal and conjunctival epithelium, as little as one drop of a 2% to 10% solution of the same substance can cause severe corneal damage. Exposure of the skin to concentrated cationic surfactants can cause dermal necrosis, apparently made worse if the skin was occluded, i.e., with a bandage, etc. If a patient is unfortunate enough to *swallow* one of these cationic detergents, you can reasonably expect that vomiting and diarrhea will ensue. However, if this chemical was of the concentrated type (10-15%), it will burn, baby, burn. The concentrated varieties, usually intended for commercial use, are very caustic and can cause burns of the oropharynx and esophagus. It seems to me that complacency in the caregiver can easily occur vis-a-vis ingestion of this class of detergents, because most of us are programmed to think of classic caustic agents such as sulfuric or hydrochloric acid, sodium or potassium hydroxide when we think of corrosive burns of the upper gastrointestinal tract. We all must learn to read labels and take nothing for granted. Do not assume; investigate!! (Goodness sakes, do I sound preachy? Listen to me carefully or you know WHO may call me home. For I am a member of the PTL — POISONS THREATEN LIFE.)

Treatment

The treatment for this poisoning is non-specific and consists merely of supportive care. If the particular cationic detergent ingested was of the non-concentrated type, then it is reasonable to attempt to dilute the material by giving the patient water or milk to drink (120 to 240 ml in adults and 15 ml/kg or less in children). It is probably reasonable to attempt gastric emptying, after dilution, but this procedure should

occur very soon after ingestion because cationic detergents are rapidly absorbed. Induced emesis or lavage may not be necessary in most cases because these products cause emesis quite readily. It is considered good practice to administer activated charcoal to these patients because cationic surfactants are well absorbed. After the charcoal, a saline cathartic or sorbitol would seem to be indicated.

If the product involved was one of the concentrated varieties (>7.5%), treat as you would a caustic burn and attempt dilution with water or milk. Do not induce emesis or perform lavage, but do get an EENT person to esophagoscope the patient to look for esophageal burns. If the eyes are involved, irrigate them with very generous amounts of water for at least 15 minutes and obtain an eye consult if indicated, especially if the concentrated kind was involved. Skin exposure is treated with large amounts of water also. Local damage to the skin can certainly occur, especially with concentrated solutions of these products. This is called getting clean the hard way. Remember that beauty is only skin deep but ugliness, like deep chemical burns, can go all the way to the bone.

The adverse systemic effects of cationic detergents are not exactly a fun way to spend time either. These potentially lethal surfactants can cause rather deep coma, convulsions, and shock with death due to respiratory paralysis. A human fatal dose, by ingestion, is estimated to be between one and three grams.

One particular form of these products, quaternary ammonium sulfate,⁵ has the potential to produce pulmonary toxicity manifested by acute alveolar edema and chronic small airway dysfunction. This surfactant product is used as an "anticleing" fabric softener. If a lady doesn't use such a substance when doing her laundry, her slip and dress can cling to her body and that may not make anyone happy except me, of course. In order to get into pulmonary difficulty with this material you must work in an area in which the chemical is heavily concentrated or be exposed to its fumes on a long-term basis. Merely washing your step-ins or skivvies in fabric softener will not cause pulmonary problems.

Horace may have been the first author to put on paper the concept "Live fast, die young, and have a good-looking corpse." In any case, he believed in spending each day as if it were the last one. He wrote such memorable lines as: "Pale Death knocks with impartial foot at poor men's hovels and king's palaces," and "Be wise, decant the wine, prune back your long-term hopes. Life ebbs as I speak; so seize each day and grant the next no credit." He also said, "Don't run on 4th down and 15." ■

AUTHORS

INSTRUCTIONS FOR SUBMITTING PAPERS

Copyright of an article published in the *North Carolina Medical Journal* is retained by the author, but the copyright to each entire issue is the property of The North Carolina Medical Society, and permission to reprint all or any part of a published article must be negotiated with the author and the editor jointly. The reprinted material must carry a credit line signifying that it appeared in the *North Carolina Medical Journal*.

Medical articles, editorials, patient oriented articles, letters to the editor and all other text submitted for publication must be double-spaced throughout, including references and legends. The material should be typed on one side of the paper with 1¼ inch margins all around. Do not use an all-caps or a script typeface. Submit one original and one copy. Please be sure to include your phone number.

The author is responsible for the accuracy of all statements and references. Acronyms and other abbreviations should be kept to a minimum; *any acronym used should be fully translated in the text*. Refer to pharmaceutical products by their generic names; brand names may follow in parentheses. Units of measure should appear in the metric system. References, typed double-spaced, should be listed in the order of their citation in the text, not alphabetically. They should follow the style used in the *Journal*.

Illustrations should be black and white glossy prints or color or black and white slides, with legends typed in double-space on a separate sheet of paper. Since the *Journal* has a limited budget for color, it may be a factor in publishing color illustrations.

Attach to the two copies of the manuscript a cover letter giving the address and telephone number of the person who will correspond about it, and address the completed communication to the Editor, Box 3910, Duke University Medical Center, Durham, NC 27710.

All manuscripts are subject to editorial changes. If extensive revision is necessary, the author may be sent a draft of the edited article for approval before publication. The author will be sent galley proofs if the paper is published.

Authors interested in more effective writing may find *The Elements of Style* by Strunk and White and *How to Write and Publish a Scientific Paper* by Day helpful.

Extracted, with permission, from *Virginia Medical* with thanks.

LIBRIUM®

chlordiazepoxide HCl/Roche

5-mg, 10-mg, 25-mg capsules

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Management of anxiety disorders; short-term relief of anxiety symptoms, acute alcohol withdrawal symptoms, preoperative apprehension and anxiety. Usually not required for anxiety or tension associated with stress of everyday life. Efficacy beyond four months not established by systematic clinical studies. Periodic reassessment of therapy recommended.

Contraindications: Known hypersensitivity to the drug

Warnings: Warn patients that mental and/or physical abilities required for tasks such as driving or operating machinery may be impaired, as may be mental alertness in children, and that concomitant use with alcohol or CNS depressants may have an additive effect. Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage. Withdrawal symptoms (including convulsions) reported after abrupt cessation of extended use of excessive doses are similar to those seen with barbiturates. Milder symptoms reported infrequently when continuous therapy is abruptly ended. Avoid abrupt discontinuation; gradually taper dosage.

Usage in Pregnancy: Use of minor tranquilizers during the first trimester should almost always be avoided because of increased risk of congenital malformations as suggested in several studies. Consider possibility of pregnancy when instituting therapy; advise patients to discuss therapy if they intend to or do become pregnant.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants, causal relationship has not been established clinically. Due to isolated reports of exacerbation, use with caution in patients with porphyria.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for maximum beneficial effects. Oral—Adults: Mild and moderate anxiety disorders and symptoms. 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients. 5 mg b.i.d. to q.i.d. (See Precautions.)

Supplied: Librium® (chlordiazepoxide HCl/Roche) Capsules, 5 mg, 10 mg and 25 mg—bottles of 100 and 500; Tel-E-Dose® packages of 100, available in boxes of 4 reverse-numbered cards of 25, and in boxes containing 10 strips of 10. Libritabs® (chlordiazepoxide/Roche) Tablets, 5 mg and 10 mg—bottles of 100 and 500; 25 mg—bottles of 100. With respect to clinical activity, capsules and tablets are indistinguishable.

What starts off as a small lesion on the mouth of an immunocompromised patient can develop into a serious and even life-threatening herpes simplex virus infection.¹ In the compromised host, oral infection may extend opportunistically to involve the esophagus or lungs or may disseminate to the liver, brain, and other organs.² Before a limited nonlife-threatening infection reaches this stage, prompt recognition and treatment with ZOVIRAX Ointment 5% can stop viral replication, accelerate healing, and reduce the accompanying pain.³

*In most patients,
a cold sore* is an annoying problem.*

*In the immunocompromised,
it can become a deadly serious one.*

ZOVIRAX® (acyclovir) OINTMENT 5%

*Stops
viral activity
and speeds
healing.*

*Due to herpes simplex virus.

INDICATIONS AND USAGE: Zovirax (Acyclovir) Ointment 5% is indicated in the management of initial herpes genitalis and in limited nonlife-threatening cutaneous Herpes simplex virus infections in immunocompromised patients. In clinical trials of initial herpes genitalis, Zovirax Ointment 5% has shown a decrease in healing time and in some cases a decrease in duration of viral shedding and duration of pain. In studies in immunocompromised patients with mainly herpes labialis, there was a decrease in duration of viral shedding and a slight decrease in duration of pain.

By contrast, in studies of recurrent herpes genitalis and of herpes labialis in nonimmunocompromised patients, there was no evidence of clinical benefit; there was some decrease in duration of viral shedding.

Diagnosis: Whereas cutaneous lesions associated with Herpes simplex infections are often characteristic, the finding of multinucleated giant cells in smears prepared from lesion exudate or scrapings may assist in the diagnosis.¹ Positive cultures for Herpes simplex virus offer a reliable means for confirmation of the diagnosis. In genital herpes, appropriate examinations should be performed to rule out other sexually transmitted diseases.

CONTRAINDICATIONS: Zovirax Ointment 5% is contraindicated for patients who develop hypersensitivity or chemical intolerance to the components of the formulation.

WARNINGS: Zovirax Ointment 5% is intended for cutaneous use only and should not be used in the eye.

PRECAUTIONS:

General: The recommended dosage, frequency of applications, and length of treatment should not be exceeded (see DOSAGE AND ADMINISTRATION). There exist no data which demonstrate that the use of Zovirax Ointment 5% will either prevent transmission of infection to other persons or prevent recurrent infections when applied in the absence of signs and symptoms. Zovirax Ointment 5% should not be used for the prevention of recurrent HSV infections. Although clinically significant viral resistance associated with the use of Zovirax Ointment 5% has not been observed, this possibility exists.

Drug Interactions: Clinical experience has identified no interactions resulting from topical or systemic administration of other drugs concomitantly with Zovirax Ointment 5%.

Carcinogenesis, Mutagenesis, Impairment of Fertility: Acyclovir was tested in lifetime bioassays in rats and mice at single daily doses of 50, 150 and 450 mg/kg/day given by gavage. These studies showed no statistically significant difference in the incidence of benign and malignant tumors produced in drug-treated as compared to control animals, nor did acyclovir induce the occurrence of tumors earlier in drug-treated animals as compared to controls. In 2 *in vitro* cell transformation assays, used to provide preliminary assessment of potential oncogenicity in advance of these more definitive lifetime bioassays in rodents, conflicting results were obtained. Acyclovir was positive at the highest dose used in one system and the resulting morphologically transformed cells formed tumors when inoculated into immunosuppressed, syngeneic, weanling mice. Acyclovir was negative in another transformation system.

No chromosome damage was observed at maximum tolerated parenteral doses of 100 mg/kg acyclovir in rats or Chinese hamsters; higher doses of 500 and 1000 mg/kg were clastogenic in Chinese hamsters. In addition, no activity was found in a dominant lethal study in mice. In 9 of 11 microbial and mammalian cell assays, no evidence of mutagenicity was observed. In 2 mammalian cell assays (human lymphocytes and L5178Y mouse lymphoma cells *in vitro*), positive response for mutagenicity and chromosomal damage occurred, but only at concentrations at least 1000 times the plasma levels achieved in man following topical application.

Acyclovir does not impair fertility or reproduction in mice at oral doses up to 450 mg/kg/day or in rats at subcutaneous doses up to 25 mg/kg/day. In rabbits given a high dose of acyclovir (50 mg/kg/day, s.c.), there was a statistically significant decrease in implantation efficiency.

Pregnancy: Teratogenic Effects. Pregnancy Category C. Acyclovir has been known to cause a statistically significant decrease in implantation efficiency in rabbits, when given at subcutaneous doses providing mean plasma levels of drug 2.2 times those expected from use in patients with normal renal function.

Reproduction studies were negative for impairment of fertility or harm to the fetus in mice given oral doses, and in rats given subcutaneous doses providing mean plasma levels of drug 84 times and 4 times (respectively) greater than those expected from use in patients with normal renal function.

Acyclovir was not teratogenic after subcutaneous administration of up to 50 mg/kg/day during the period of organogenesis in rats and rabbits; doses up to 450 mg/kg given daily by gavage to mice were not teratogenic. There are, however, no adequate and well-controlled studies in pregnant women. Acyclovir should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers: It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when Zovirax is administered to a nursing woman.

ADVERSE REACTIONS: Because ulcerated genital lesions are characteristically tender and sensitive to any contact or manipulation, patients may experience discomfort upon application of ointment. In the controlled clinical trials, mild pain (including transient burning and stinging) was reported by 103 (28.3%) of 364 patients treated with acyclovir and by 115 (31.1%) of 370 patients treated with placebo; treatment was discontinued in 2 of these patients. Other local reactions among acyclovir-treated patients included pruritus in 15 (4.1%), rash in 1 (0.3%) and vulvitis in 1 (0.3%). Among the placebo-treated patients, pruritus was reported by 17 (4.6%) and rash by 1 (0.3%).

In all studies, there was no significant difference between the drug and placebo group in the rate or type of reported adverse reactions nor were there any differences in abnormal clinical laboratory findings.

DOSAGE AND ADMINISTRATION: Apply sufficient quantity to adequately cover all lesions every 3 hours 6 times per day for 7 days. The dose size per application will vary depending upon the total lesion area but should approximate a one-half inch ribbon of ointment per 4 square inches of surface area. A finger cot or rubber glove should be used when applying Zovirax to prevent autoinoculation of other body sites and transmission of infection to other persons. Therapy should be initiated as early as possible following onset of signs and symptoms.

NOW SUPPLIED: Zovirax Ointment 5% is supplied in 15 g tubes (NOC 0081-0993-94). Each gram contains 50 mg acyclovir in a polyethylene glycol base. Store at 15°-25°C (59°-77°F) in a dry place.

Patients Are Now Looking Better Than Ever.

Magnetic Resonance Imaging is the most advanced diagnostic technology of the last 25 years. The quality of MRI images is helping physicians make easier, more accurate diagnoses.

Now, Craven County Hospital, in cooperation with Lenoir Memorial Hospital and Onslow Memorial Hospital, is bringing this technology to more physicians in Eastern North Carolina through MRI Ltd. The MRI unit is housed in a large van and will travel between New Bern,

Kinston, and Jacksonville.

From these sites, it will serve physicians and patients of Craven County, Lenoir Memorial, Onslow Memorial, Beaufort

County, Carteret General, Pitt Memorial, and Wayne Memorial Hospitals.

For more information or to refer patients, call Craven County Hospital at 919-633-8218 or toll free 1-800-682-0276.

Magnetic Resonance Imaging. It's helping patients look better than ever.

Prototype PA

James F. Gifford, Jr., Ph.D.

Formal training for physician assistants entered its twentieth year in 1985, with the role firmly established among the ranks of American health professionals. During the past two decades PAs have entered a wide variety of general and specialized practice settings,¹ the success of PAs being due in significant part to their adaptability. This adaptability reflects the complex social origins of the role, which included the increasingly positive value placed on health care by Americans in the twentieth century, the social reform pressures characteristic of the 1960s, awareness in the medical community of other physician-extender models both in this country and abroad, and the many specific needs for clinically trained personnel that emerged, at the Duke University Medical Center and elsewhere, out of the attempt to deliver quality medical care to all Americans.²

Historically, however, the most specific forerunner of formal physician assistant training was the family practice of Amos Johnson, M.D., and Henry Treadwell of Garland, North Carolina. The story of their professional relationship, which began in 1940 and ended with the death of Dr. Johnson in 1975, not only recalls the roots of the PA role but also raises the question of how best to conserve and expand the experience of PAs in mid-career when their original practice settings change or close.

Family Background

Garland, North Carolina, was a rural community of approximately 500 in the Piedmont section of North Carolina, the surrounding population consisting of almost equal numbers of whites and blacks. Jefferson and Mary Johnson farmed in the area in the early decades of the twentieth century, but pointed their sons toward the professions. Their eldest son, James, became an engineer of international reputation. The second boy, Jefferson, entered law school and sat eventually on the North Carolina Supreme Court. Mrs. Johnson hoped that her youngest son, Amos, would become a Presbyterian preacher, but the influence of her husband prevailed and Amos, after graduating from Duke University

in 1929, entered medical school at the University of North Carolina. After two years he transferred to the University of Pennsylvania, taking his M.D. in 1933.

Following an internship at Jackson Memorial Hospital in Miami, Florida, Johnson returned to North Carolina to join his brother-in-law in practice at Lincolnton. Shortly thereafter, however, Mrs. Johnson was killed in an accident and Johnson returned to Garland temporarily so that his father would not be alone in the house. The temporary arrangement was to last 43 years.

Initially Johnson practiced in his father's house, using one front room as his office and the front porch as a waiting room. His local roots, respected family, and personable manner quickly brought large numbers of patients. He soon married Mary Porter Allan, a laboratory technician whom he met when he was an intern and she a student in Miami. Together they planned and built offices designed to serve as many patients as possible, with office routine reflecting the area's racially based social structure.

The Practice Setting

For the farm families of the Garland area, "going to the doctor" was a social occasion, a chance to visit with friends in town and catch up on the local news. The demands of farming, travel time, and the unpredictability of illness and trauma made the scheduling of medical care difficult. Accordingly, the Johnsons decided to run their practice without making appointments.

Their offices were built with a large waiting room at the front, divided in the center by a wall with a large open door. Whites entered through the front door and blacks at the side. Once inside, all were treated on a first-come, first-served basis, Mrs. Johnson determining the order in her capacity as office manager. Swinging doors separated the waiting room from the treatment area, a large room with an examining table surrounded by six examining rooms, each with a hospital bed. This arrangement allowed Dr. Johnson to call seven patients at a time for treatment, office assistants preparing each of them after routine lab tests from Mrs. Johnson.

After each round of visits, Dr. Johnson called the patients together for what he called "group therapy," instructing

From Department of Community and Family Medicine (History of Medicine), Box 3702, Duke University Medical Center, Durham 27710.

each in turn about regimen and medications while holding a telephone open to the local pharmacy so that the druggist heard exactly what the patient was told. Mrs. Johnson entered this information in the charts and accepted payment, after which the patient went directly to the pharmacy, if necessary, where his or her prescription was already waiting. The large patient volume made possible by this efficient organization helped keep costs low: even in the 1960s the cost of an office visit to Dr. Johnson, routine lab work included, was three dollars.

As the practice grew, the office assistants became the key to efficiency. Not only did they keep the treatment area clean and prepare patients for Dr. Johnson, but they also were responsible for controlling the large number of children who visited the practice and for seeing to it that the noise of conversations in the waiting area did not become too distracting to Johnson. Although the Johnsons occasionally employed an RN, most of their office assistants over the years were young women from the community who were known, both as individuals and by family, to the Johnsons and who were trained by them for the job. Eventually it was felt that a male assistant would be useful, both to prepare the male patients and to deal with the children. Accordingly, the Johnsons hired Henry Lee Treadwell, a recent high school graduate whose aunt was employed by the Johnson family as a domestic and whose entire family was known to them. Treadwell possessed the three qualifications the Johnsons required of their assistants. He was likeable, honest and trainable.

The Training of Henry Treadwell

As it developed, Treadwell possessed two characteristics which were to permit him to go far beyond the role of office assistant. The first was that he was "all ears." He had a remarkable capacity for absorbing information and an insatiable curiosity. The second was that he, like Amos Johnson, was an avid sportsman who loved to hunt. Whenever possible the two men spent hours in the woods, talking medicine from the time they left until the time they returned. What they talked about Johnson then illustrated, as occasion permitted, in the office.

Treadwell's training was by apprenticeship. He quickly mastered the task of maintaining the office routine and was instantly popular with the children. With both Dr. and Mrs. Johnson increasingly pressed for time by the increasing number of patients, each allowed "Buddy," as Treadwell was known, to observe procedures, to learn them under direct supervision, and to handle them himself once competent. When the doctor heard something interesting through his stethoscope, Treadwell listened both to the sound and then to an explanation. In the early days Johnson would begin to suture a wound, then allow Treadwell to finish. Soon he was suturing without direct supervision. Similarly, "Monk," as Mrs. Johnson was known, taught Treadwell

about blood tests and urinalysis, procedures which she often left to him once he was competent.

His competence won him respect from the entire community, and he was the object of particular devotion from the children, who frequently demanded, whatever the procedure, that the doctor "let Buddy do it." Treadwell gained for himself not only technical competence but also an appreciation of the relationship between science and personality in the art of medicine. As his understanding grew, the scope of his conversations with Johnson broadened, to the delight of both.

In the absence of the Johnsons, Treadwell increasingly handled emergencies at the office, working up patients and referring them to Sampson County Memorial Hospital in Clinton, the county seat. So precise were his reports that physicians there accepted his referrals as if they had come from Johnson himself. Later this was true also at the Duke University Medical Center, the central referral hospital for the area. The drug and equipment salesmen who called on the Johnsons also came to rely on Treadwell, explaining their wares and depending on him to replay their spiels to the doctor when he had time available. From almost every conversation, Treadwell learned something new.

He learned even more from his interactions with the medical students who rotated through the practice as preceptees. Dr. Wilburt C. Davison, Professor of Pediatrics and Dean of the Duke University School of Medicine, believed that his house staff should be trained in practice organization and family medicine, and for these Johnson came to have a nationwide reputation. From his first days in practice, Johnson found that his medical training did not have the correct balance for general family practice. Early on he sought additional instruction, first in dermatology, then in pediatrics, then in other subjects. He became a powerful advocate of reforming the medical curriculum to prepare doctors for family practice by offering them an intense but more generalized experience. Davison shared these concerns, and sent students to Johnson both to learn family practice and to absorb Johnson's values.

Because of his years of experience, Treadwell often became, however inadvertently, an instructor to these students in practical matters. On one occasion, while a student was ransacking his manuals to diagnose what turned out to be a black widow spider bite, Treadwell left, obtained antivenom from the pharmacy, loaded a syringe, and handed it to the student when he asked "Do you have black widow spiders around here?" As the students learned detail from him, Treadwell learned theory from them and became known personally to a generation of Duke graduates.

Family Practice and the PA Role

Beginning in the 1950s, concern mounted in America that medicine was becoming over specialized and that there was need to increase the number of family physicians. Amos

Johnson became a national spokesman for this concern. As a charter member of the North Carolina Chapter of the American Academy of Family Physicians (1948), and later as president of the North Carolina chapter, president of the North Carolina Medical Society, national president of the Academy, and delegate from North Carolina to the American Medical Association, he lobbied both in the state capital at Raleigh and in Washington. His goals were establishment of family practice as a recognized specialty, with family practice programs in the state's medical schools, and passage of what became the Family Practice of Medicine Act (1969).

He was a consummate politician, and his leadership was applauded across the political spectrum from Senator Edward M. Kennedy to Senator Jesse Helms. Congressman H. Richardson Preyer credited Johnson with doing "More than any one man to promote the necessity of Family Practice." His political activities brought dozens, if not hundreds, of medical and political leaders into contact with the details of his personal practice and, necessarily, into general awareness of his assistant, Henry Treadwell. As one doctor recalled, "As we made rounds in his office with his black physician's assistant of thirty years, I always learned something new . . ."³

By the mid-1960s, when the political activity leading to the establishment of family practice as a specialty was at its height, the evolution of Henry Treadwell from office assistant to physician assistant also was complete. Involvement in the practice and the medical activities of Amos Johnson provided Treadwell with a unique apprenticeship. He was trained both in clinical procedures and in their supporting laboratory technologies, although his formal education had stopped at high school. His primary roles were to multiply the hands of his host physician in the conduct of practice and to do whatever else was necessary to ensure efficient administration. Because he was trained in advance for no single set of responsibilities, he was free to develop himself in accord with the unique circumstances of his practice setting. And, because of his personal competence and his association with Amos Johnson, he was widely known and generally respected.

Among those who had a general knowledge of his role was Dr. Eugene A. Stead, Jr., Professor and Chairman of the Department of Medicine at the Duke University Medical Center. During the early 1960s Stead was charged with developing clinical staff for the specialty services of Duke Hospital, increasing the number of area physicians attending the continuing education programs of the Medical Center, and being generally attentive to the task of improving delivery of health care in the Carolinas. The training of a new type of assistant to physicians would contribute in each of these areas.⁴

Although Amos Johnson himself was not sure that formal training of PAs could succeed as well as apprentice training, Johnson's success with Henry Treadwell helped shape Stead's prototype definition of the PA role and win federal support

for PA training. In recognition, the Duke program awarded Treadwell an honorary certificate of graduation in 1968.

End of the Practice, and a New Question

By the time of Treadwell's symbolic graduation he had been in practice with Amos Johnson for almost thirty years. Both men could foresee the day when the practice would close. What, then, would Treadwell do? While his clinical skills and perhaps his administrative ability were transferable to another setting, the personal relationships that were also part of the basis of his professional respect were unique to Garland, and the routines that gave shape to his administrative ability were unique to his practice. In anticipation of the possibility that no suitable medical situation would be available, Johnson bought a farm for Treadwell that adjoined one that had been left to Treadwell's wife. As events developed, no suitable medical situation presented itself. When Johnson died in 1975 some of the physicians at the hospital in Clinton discussed a position for Treadwell, as did physicians from Elizabeth City, who took over some of Johnson's patients. Either position, however, meant relocation. Treadwell did some work for the physicians who took over the patients, but it just wasn't the same. Today Treadwell runs a restaurant in Garland. His personal relationships thus were maintained, but his experience was lost to medicine.

As the first generation of formally trained PAs reaches mid-life and mid-career, some will find themselves in situations analogous to Treadwell's. The uniqueness of each PA practice setting and the dependence of each PA upon the license of a supervising physician mean that some PAs will be more successful than others in new roles when a sponsoring physician retires or dies or a specialty agency closes or changes function. Not only may the matching of skills to situations be chancy, but the dynamics of older, and more expensive, PAs seeking positions with younger physicians have yet to be examined in experience. There may well be need for PAs as a professional group to seek new and rewarding areas of service and practice for their most experienced men and women. ■

"De Facto Collusion" in the Health Insurance Industry

Implications for Physicians

James P. Weaver, M.D.

The health insurance industry has consistently shaped its terminology to increase its influence over the health care market. By the use of carefully chosen phrases, the insurance companies have attempted to publicly label physicians as unreasonable, wasteful, and "no better, or different, from anyone." This tactic is helping them gain control of a once physician-dominated realm. For example, the recent effort of the Travelers Insurance Company to label itself "Patient Advocate" is an escalation of this linguistic technique. It indicates an attempt by an insurance company to usurp the traditional role of the physician.

The verbal manipulation of the image of the physician by multiple competing insurance companies demonstrates the principle of "de facto collusion" which the health insurance industry is using so successfully. If organized medicine is to defend any domain in the delivery of health care, it must follow the example of the insurance industry, and respond with "de facto collusion" of its own.

(Un)usual, (Un)customary, (Un)reasonable

One of the oldest and most effective phrases is the "usual, customary, and reasonable" used by Blue Cross. As old as the company itself, this phrase has stood the test of time. It is still used, behind the shield of the legal constraints against "price fixing," to conceal the complete pricing picture, and to place those who are outside its secret limits immediately into the category of "unreasonable." Who is to know that "the ninetieth percentile at the seventy-fifth percentile with a twenty percent withhold" is the level used to determine what is "reasonable"? Can a charge that is "unusual, unc customary, and unreasonable" possibly be justified or fair? No physician would wish to be labeled in such a manner, and most have tried to place their charges to avoid this designation. Patients are most often inexperienced, worried, and stressed, and have little objective information in their medical encounters upon which they

may base conclusions. Receiving a check from your insurance company that states "your doctor's charges are greater than the usual, customary, and reasonable" effectively places the physician in a compromised position in the eyes of his or her patient. This is precisely what Blue Cross is trying to accomplish.

Costwise Providers and Patient Advocates

Blue Cross has attempted to label as wasteful those physicians who do not join the Blue Cross insurance plans. By naming a plan "Costwise," and the "joiner" physician a "Costwise physician," there is an inference that the physician who did not sign up is "cost foolish," or unconcerned about costs. The policy of sending the check to the patient with the statement that the physician is not a "cost wise" physician is particularly misleading to the public. It would be more honest, albeit not as effective, for Blue Cross to simply say that the patient's physician did not wish to submit to the conditions of the Blue Cross contract to physicians. Blue Cross has effectively used this catch phrase to label the physician derogatorily in the eyes of the public.

Because they deal with many different entities, the insurance companies introduced the term "provider" as a convenience. Their "convenience," however, resulted in the added dimension of removing the term "physician" from our designation. The implication, that the physician is just another "provider," is a great advantage to the insurance industry. Besides deserving no special treatment or compensation for their "providing," physicians are instantaneously divested of the esteem associated with the old terminology. This change is effectively contributing to the transformation of the physician from the "captain of the ship" to one of the crew. Physicians are now to be viewed no differently from any of the "providers": the impersonal hospital, the nurse practitioner, the physical therapist, or the dietitian.

"Providers" are a new breed, more easily subjected to the restrictions and interventions of the third parties. Second

opinions, utilization review, denial of claims, and "unnecessary operations" somehow are applied to "providers" more easily than to "physicians." This terminology has caught on so rapidly that I have heard physicians refer to themselves as a patient's "primary provider."

Physicians will do better if they do not abandon their traditional label for the modern insurance company substitute. It is important that we continue to view ourselves as "physicians," and to recognize the distinction. As he or she works for an insurance company, a "provider" will sacrifice much professional freedom. A "physician," working for his or her patients, is not placed in the same compromising position.

In addition to re-naming the physician's role, at least one insurance company is re-naming its own role to the detriment of physicians. Recently, the Travelers Insurance Company has made a verbal attempt to shift the traditional role of the "Patient Advocate" from the doctor to the insurance company. The utilization review nurses at The Travelers now refer to themselves as "Patient Advocates." Their role, as defined in letters to patients, is to "help you (the patient) make more informed medical decisions." These "Patient Advocates" inform the patient that they will be contacting the "treating physician at regularly scheduled intervals to review whether the proposed length of stay is appropriate or should be modified."

I have always believed that it was the role of the physician to help the patient make "informed medical decisions." It appears that The Travelers believes otherwise. The move to usurp the usual province of the physician is a new and malignant escalation of this verbal assault. Other terms, such as "provider," "costwise," or "unreasonable," were used to make the public believe the physician was something other than his or her true self. Now the core of the professional life of the physician — our traditional role as Patient Advocate — has become the target at which The Travelers has taken aim. The implication that The Travelers will monitor the physician for the "good" of the patient's medical care is an attempt to strip physicians of their professional identity.

De Facto Collusion: Fighting Fire with Fire

Physicians remain at a disadvantage in this struggle. The 1975 Supreme Court decision in *Goldfarb v. Virginia State Bar* placed the "learned professions" under the close scrutiny of the Federal Trade Commission. As "competitors," physicians are now not allowed to act as a group because these actions may be considered "in restraint of trade" and may result in antitrust violations. It seems clear, however, that because of its "usual and customary" methods, the health insurance industry is approaching the medical profession as a unified force. Even though the individual insurance companies are obvious competitors, they are acting toward the Medical Profession as if they are cooperating with each

other. In this sense they have used "de facto collusion." Their actions, not only the verbal assaults, but the "organizational" interferences as well, are affecting the profession of medicine as if they originate from a single source.

The lesson for Medicine is actually quite simple. The reason the insurance industry has been so effective in its effort to control the health care market is its singleness of purpose. Medicine must also develop this sense of common direction. Medicine must begin to function with the purpose and the same force of "de facto collusion" that the insurance industry has shown us.

"De facto collusion" occurs after the individuals in a group have comprehended their common predicament and goals, and have begun to act as a unit. If fifty people are sitting in burning building, they do not have to have a meeting to decide to leave. They sense the danger and leave, as a group.

To gain this insight, physicians must begin a new effort to educate one another. We must inform each other of what is happening to our lives and to our ability to practice medicine. We must begin to write, read, and talk with each other on a regular basis. Which group has joined which HMO, and why? Which insurance companies are coming into town, and what is their pattern of operation in other cities in which they have operated? What are the experiences of other physicians in my town in dealing with a particular insurance company? How is this or that insurance company affecting the care of my patients? What is happening to my income since I joined "X" insurance company? Chances are that your experiences are similar to those of your associates. It is a thorough understanding of these experiences that will begin to paint a picture of the "situation" for all of us. Only then can we hope to gain the common level of experience that will allow physicians to begin to act with a collective direction, without collusion and within the constraints of the law.

Finally, if Medicine is to maintain any element of influence in our future health care delivery system, it must respond to these recent pressures with the same basic ethic that allowed it once to flourish. If we can follow the central teaching of Medicine, that the Patient is the single most vital concern in all medical encounters, we, as physicians, will surely find a proper course and eventual success in the conflict ahead.

Because of the verbal attack by the insurance industry, Medicine has actually been given an opportunity to reevaluate the meaning of our "Profession." As physicians, we must protest the labels "provider," "unreasonable," and "costwise," and reaffirm our traditional role of Patient Advocate. As we educate our patients and ourselves to the significance of these terms, our professional self-respect will improve, and we will certainly develop a clearer sense of our common professional predicaments. This understanding may help our currently fragmented profession begin to act with greater unity and direction as Medicine begins to utilize "de facto collusion" of its own. ■

American Teens and Birth Control

Commentary

S. DuBose Ravenel, M.D.

The Report on a survey by Planned Parenthood Federation in the May issue of NCMJ (American teens speak, 1987;48:267-70) is of interest to those who share concern about the problem of unmarried teenage pregnancies. Careful analysis of the complete study¹ from which the Report was derived reveals several facts not mentioned in the Report but of equal or greater interest in making conclusions from the data obtained.

Planned Parenthood makes a point that many teenagers are sexually active, but many do not usually use birth control, with high rates of teenage pregnancy being the "inevitable result." They stress increasing the use of birth control as a solution. In order for increased use of birth control to lead to a reduction in teenage pregnancies, it must be assumed that increased education in and use of birth control among unmarried adolescents does not lead to an increase in sexual activity or that any such increase would be outweighed by a reduction in pregnancy rates. The idea that increased availability and use of contraceptives among teens would lead to a reduction in pregnancy rates is an unproven assumption specifically mentioned in the text of the poll. Findings included within the data from which the Report was written, but not mentioned in the Report, raise concern about the possible effect of increased sexual activity related to increased birth control education:

1 Teenagers who talked with their parents about sex and birth control were more likely to have had intercourse than those who had talked about sex but not birth control.

2 The rate of sexual activity among teens who had a "comprehensive" sex education course in school (defined as including information on contraception) was more than one-third higher than among teens exposed to sex education without birth control information or not provided sex education in school.

¹The references to the "complete study" from which the Report was derived are to the complete, original poll published by Planned Parenthood, not to the pamphlet from which the highlights were selected for the Report.

Sources other than Planned Parenthood have concerns about the possibility of increased teenage sexual activity following provision of contraception, including the following: one year after starting oral contraceptives a group of teenage clinic patients in Detroit were found to be "moderately more" sexually active, having intercourse an average of 4.3 times a month before admission to the clinic and 6.8 times a month one year later.¹ Furstenberg commented in 1981 that "even the most dedicated proponents of widespread contraceptive information availability for teenagers are aware that their efforts may promote sexual activity . . ."² The National Research Council in its widely quoted report "Risking the Future" acknowledges that birth control information and provision to adolescents is associated with increased rates of sexual activity, and suggests the possibility that this may be a causal relationship.³ Margiglio and Mott point out that adolescents who have previously taken a sex education course are "somewhat more likely" than those who have not to initiate sexual activity at ages 15 and 16.⁴ Pietropinto found that 81% of 400 randomly selected family physicians and psychiatrists who responded to a nationwide survey on contraception believed that increased availability of contraceptives had led to increased sexual activity among teenagers.⁵

Finally, and most importantly, the issue of pregnancy rates among teens exposed to sex education with birth control information/availability is not addressed by the Planned Parenthood poll. Olsen and Weed in an exhaustive analysis of data from 50 states have shown that provision of family planning services to adolescents is associated with an increase in pregnancy rates and that this association is not explained by the logical possibility that such an increase would simply reflect placement of such services in areas of greatest need.⁶ Despite provision of birth control information and prescriptions in school-based health clinics (SBCs), either directly or through referral, no reduction in pregnancy rates in the population exposed to such programs has been confirmed. The prototype for such clinics, in St. Paul, Minnesota, in 1980 was reported to have shown a 40% decline in pregnancies, attributed to the family planning services rendered, along with a 23% reduction in fertility.⁷ Subsequently the administrator of the St. Paul SBCs has reported

that a decline in *births* was found but that whether the decline was due to a decrease in the number of pregnancies or to an increase in abortions could not be determined.⁸

Another frequently cited program providing family planning services to teens in Baltimore clinics located close to schools reported a significant decline in pregnancy rates among students exposed to the program compared with students not enrolled in the program.⁹ Pregnancy rates were defined as a percentage of sexually active students only, however, so that if, as a result of the program, pregnancies increased, but less markedly than sexual activity increased, an actual increase in pregnancies would appear as a reduction. Using data from 1974 to 1980 nationwide, the United States Department of Health and Human Services reported this exact phenomenon; pregnancies among 15- to 19-year-olds increased by 8.2%, but if shown as percent age of sexually active teens only, pregnancies appeared reduced by 5.7%.¹⁰

It is of interest, furthermore, that although the Baltimore data were reported to show an *average* of seven months' "apparent postponement" of first intercourse among students exposed to the program for three years, of the more than 1,000 initially enrolled only 96 girls had three-year exposure, and the number of girls who "apparently postponed" coitus is not provided.

Pregnancy rates among teens using oral contraceptives with a high rate of compliance have been reported to be 9.9% to 13%,¹¹ compared with a pregnancy rate in the entire teen female population of 10%. If, therefore, sex education and birth control education/availability are causally related to increased rates of sexual activity in teens, with pregnancy rates among high-compliance contraceptive users similar to those in the teen population as a whole, Planned Parenthood's focus on removing barriers to the use of birth control among unmarried teens has considerable potential for inadvertently aggravating the very problem it is designed to alleviate.

Another finding in the poll which was not noted in Planned Parenthood's Report was that only 14% of the sexually active teenagers who themselves did not usually use birth control attributed their not using protection mainly to a lack of knowledge or access. Therefore, along with possible undesirable effects, it is doubtful that education and availability would significantly affect consistency of use of birth control among sexually active teens. Cutright, in commenting on the failure of contraceptive programs to decrease pregnancies among unmarried teens, said in 1972, "areas with weak programs or no programs at all experience smaller increases or larger declines (in pregnancy) than are found in (areas with strong contraceptive programs)."¹²

These observations leave aside the fact that to condone or promote contraception among unmarried teenagers implies approval of what is in many states illegal behavior,

and also directly opposes the safer and more appropriate educational focus on promoting premarital abstinence. It is sexual intercourse, not "failure to use contraception," that causes pregnancy.

Cervical cancer is another issue of concern. Barron in his report of consequences of sexual activity in British teens under 16 years of age found that the risk of carcinoma of the cervix doubled in women who began sexual activity before the age of 17. He thus pointed out the combined medical and moral basis for discouraging sexual activity in young teens.¹³

It is time to follow the American Medical Association's 1984 resolution promoting premarital abstinence, and to support and encourage other teenagers to join the 72% of adolescent girls who report abstaining from sex, rather than to advocate policies that may compound the problem. ■

In Time

Brent Weston, M.D.

I evaluated an infant for "failure to thrive." His mother was ineligible for adequate support, and she shared the infant's formula. At this time, there was a rather bitter attack on the medical establishment in the lay press (Newsweek, Jan. 26, 1987), and I was working on choosing a research fellowship (molecular biology).

I see a time when we will fix a gene
To heal his heart, or save her brain;
To stop a tumor, and lift the pain.

But few will seek our care
That dying day of cure;
A time when hungry mothers drink
Their infants' meager share;
And plastic hearts still beat
On greens in West Palm Beach.

And yet in time, the Oath holds true:
To use our gift with care,
Not pride, or fad, or greed;
To give ourselves for those in need.

Pediatric Resident, North Carolina Memorial Hospital,
Chapel Hill 27514.

**The benefit of antianginal
protection plus safety...**

CARDIZEM:
diltiazem HCl/Marion

A FULLER LIFE

■ **A remarkable safety profile^{1,6}**

The low incidence of side effects with Cardizem allows patients to feel better.

■ **Protection against angina attacks^{1,5,7-9}**

The predictable efficacy of Cardizem in stable exertional* and vasospastic angina allows patients to do more.

■ **A decrease in myocardial oxygen demand**

Resulting from a lowered heart rate-blood pressure product.⁵

■ **Compatible with other antianginals^{6†}**

■ **Safe in angina with coexisting hypertension, COPD, asthma, or PVD^{1,3,5,6}**

*CARDIZEM® (diltiazem HCl) is indicated in the treatment of angina pectoris due to coronary artery spasm and in the management of chronic stable angina (classic effort-associated angina) in patients who cannot tolerate therapy with beta-blockers and/or nitrates or who remain symptomatic despite adequate doses of these agents

†See Warnings and Precautions.

CARDIZEM[®] ANTIANGINAL PROTECTION

diltiazem HCl/Marion PLUS SAFETY

Usual maintenance dosage range: 180-360 mg/day

Brief Summary

Professional Use Information

CARDIZEM[®]

(diltiazem HCl) 30 mg, 60 mg, 90 mg, and 120 mg Tablets

CONTRAINDICATIONS

CARDIZEM is contraindicated in (1) patients with sick sinus syndrome except in the presence of a functioning ventricular pacemaker, (2) patients with second- or third-degree AV block except in the presence of a functioning ventricular pacemaker, and (3) patients with hypotension (less than 90 mm Hg systolic).

WARNINGS

- Cardiac Conduction.** CARDIZEM prolongs AV node refractory periods without significantly prolonging sinus node recovery time, except in patients with sick sinus syndrome. This effect may rarely result in abnormally slow heart rates (particularly in patients with sick sinus syndrome) or second- or third-degree AV block (six of 1,243 patients for 0.48%). Concomitant use of diltiazem with beta-blockers or digitalis may result in additive effects on cardiac conduction. A patient with Prinzmetal's angina developed periods of asystole (2 to 5 seconds) after a single dose of 60 mg of diltiazem.
- Congestive Heart Failure.** Although diltiazem has a negative inotropic effect in isolated animal tissue preparations, hemodynamic studies in humans with normal ventricular function have not shown a reduction in cardiac index nor consistent negative effects on contractility (dp/dt). Experience with the use of CARDIZEM alone or in combination with beta-blockers in patients with impaired ventricular function is very limited. Caution should be exercised when using the drug in such patients.
- Hypotension.** Decreases in blood pressure associated with CARDIZEM therapy may occasionally result in symptomatic hypotension.
- Acute Hepatic Injury.** In rare instances, significant elevations in enzymes such as alkaline phosphatase, CPK, LDH, SGOT, SGPT, and other symptoms consistent with acute hepatic injury have been noted. These reactions have been reversible upon discontinuation of drug therapy. The relationship to CARDIZEM is uncertain in most cases, but probable in some. (See PRECAUTIONS.)

PRECAUTIONS

General. CARDIZEM (diltiazem hydrochloride) is extensively metabolized by the liver and excreted by the kidneys and in bile. As with any new drug given over prolonged periods, laboratory parameters should be monitored at regular intervals. The drug should be used with caution in patients with impaired renal or hepatic function. In subacute and chronic dog and rat studies designed to produce toxicity, high doses of diltiazem were associated with hepatic damage. In special subacute hepatic studies,

oral doses of 125 mg/kg and higher in rats were associated with histological changes in the liver which were reversible when the drug was discontinued. In dogs, doses of 20 mg/kg were also associated with hepatic changes, however, these changes were reversible with continued dosing.

Drug Interaction. Pharmacologic studies indicate that there may be additive effects in prolonging AV conduction when using beta-blockers or digitalis concomitantly with CARDIZEM. (See WARNINGS.)

Controlled and uncontrolled domestic studies suggest that concomitant use of CARDIZEM and beta-blockers or digitalis is usually well tolerated. Available data are not sufficient, however, to predict the effects of concomitant treatment, particularly in patients with left ventricular dysfunction or cardiac conduction abnormalities. In healthy volunteers, diltiazem has been shown to increase serum digoxin levels up to 20%.

Carcinogenesis, Mutagenesis, Impairment of Fertility. A 24-month study in rats and a 21-month study in mice showed no evidence of carcinogenicity. There was also no mutagenic response in *in vitro* bacterial tests. No intrinsic effect on fertility was observed in rats.

Pregnancy. Category C. Reproduction studies have been conducted in mice, rats, and rabbits. Administration of doses ranging from five to ten times greater (on a mg/kg basis) than the daily recommended therapeutic dose has resulted in embryo and fetal lethality. These doses, in some studies, have been reported to cause skeletal abnormalities. In the perinatal/postnatal studies, there was some reduction in early individual pup weights and survival rates. There was an increased incidence of stillbirths at doses of 20 times the human dose or greater.

There are no well-controlled studies in pregnant women; therefore, use CARDIZEM in pregnant women only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers. Diltiazem is excreted in human milk. One report suggests that concentrations in breast milk may approximate serum levels. If use of CARDIZEM is deemed essential, an alternative method of infant feeding should be instituted.

Pediatric Use. Safety and effectiveness in children have not been established.

ADVERSE REACTIONS

Serious adverse reactions have been rare in studies carried out to date, but it should be recognized that patients with impaired ventricular function and cardiac conduction abnormalities have usually been excluded.

In domestic placebo-controlled trials, the incidence of adverse reactions reported during CARDIZEM therapy was not greater than that reported during placebo therapy.

The following represent occurrences observed in clinical studies which can be at least reasonably associated with the pharmacology of calcium influx inhibition. In many cases, the relationship to CARDIZEM has not been established. The most common occurrences as well as their frequency at presentation are: edema (2.4%), headache (2.1%), nausea (1.9%), dizziness (1.5%), rash (1.3%), asthenia (1.2%). In addition, the following events were reported infrequently (less than 1%).

Rx

Cardizem[®]
(diltiazem HCl)

☐ 60 mg ☐ 90 mg

☐ 120 mg

Sig: tid

Cardiovascular	Angina, arrhythmia, AV block (first degree), AV block (second or third degree — see conduction warning), bradycardia, congestive heart failure, flushing, hypotension, palpitations, syncope
Nervous System	Amnesia, gait abnormality, hallucinations, insomnia, nervousness, paresthesia, personality change, somnolence, tremor, tinnitus
Gastrointestinal	Anorexia, constipation, diarrhea, dyspepsia, dyspepsia, mild elevations of alkaline phosphatase, SGOT, SGPT, and LDH (see hepatic warnings), vomiting, weight increase
Dermatologic	Petechiae, pruritus, photosensitivity, urticaria
Other	Amblyopia, dyspnea, epistaxis, eye irritation, hyperglycemia, nasal congestion, nocturia, osteoarthral pain, polyuria, sexual difficulties

The following postmarketing events have been reported infrequently in patients receiving CARDIZEM: alopecia, gingival hyperplasia, erythema multiforme, and leukopenia. However, a definitive cause and effect between these events and CARDIZEM therapy is yet to be established.

Letters to the Editor

On child safety

To the Editor:

To measure the prevalence of two important preventive practices in the parents/guardians of a pediatric age population, 125 consecutive patient encounters by a single physician were evaluated for seatbelt or car seat use on the trip to the clinic and for the presence of Ipecac in the child's home. The population sampled is largely indigent and from a moderate-size North Carolina city.

These two practices were chosen for study because of their potential great benefit. It is well established that motor vehicle accidents are the leading cause of death in the five to 14 age group. Less deadly but affecting perhaps one million children yearly are accidental toxic ingestions, for which Ipecac syrup is an important mode of secondary prevention of ill effects.

The results, summarized in the table below, show a reported seatbelt use rate of 74%. Whatever the social or legal influences behind it, this reported rate is reassuring evidence that seatbelt or carseat use has wide support among parents of this pediatric population. Interestingly, 31% of non-belt use was due to the lack of belts on city buses.

The data on Ipecac is less encouraging; nine of ten parents did not keep Ipecac in the home. However, 62% of those reporting Ipecac in the home had received samples from a county health department. This is evidence of the positive effect a local health department may have on important preventive measures in child safety.

	Yes (%)	No (%)	Total
Child in seat belts or car seat on the trip to the clinic	93 (74)	32 (26)	125
Ipecac kept in the home	16 (15)	91 (85)	107

About a General Accounting Office report

To the Editor:

Of significance to every practicing physician is the recently published General Accounting Office report concerned with medical professional liability which contains specific recommendations. Because this is the product of an extensive indepth study it is certain to gain the attention

of many legislative bodies.

The report has sections devoted to reducing injuries, improving communication, reforming tort law, providing alternative dispute resolution, and one devoted to the insurance industry. Medical incompetence was cited as a significant issue to be resolved and improved peer review was recommended. They suggested that risk management training be made mandatory.

They emphasized the need for improved communication and advocated tort reform which would hopefully result in more efficiency, predictability, and equity in the way that medical malpractice claims are resolved. Alternate dispute resolution suggestions included arbitration screening panels and no fault. They recognized that there is a potential for resolving claims in a more efficient, timely, and equitable manner, but stated that a lack of data prevented them from making specific recommendations. They indicated that "reasonable and correct" regulation of the professional liability insurance industry should be supervised by the insurance commissioners of the various states.

This GAO report will be perused by various legislative bodies. It should, therefore, be reviewed by health care providers, for without our input, the result may be change rather than progress.

On care of the elderly in Great Britain

To the Editor:

I have just returned from a trip to Great Britain to see how those folk take care of their elderly (they proportionately have more of these folks than we do, and might give us some ideas for the future). It was heartening to see the extensive out-of-hospital community supports which are in place which greatly exceed what we have, and which because of the National Health Service, are available to all — regardless of means.

It was less heartening to appreciate the tensions placed on the system by the political decision to "cut back" on health expenditures (which are so remarkably less than ours). This decision to "cut back" despite the fact that the hospitals are struggling still to become "up to date" has limited the amount of technology accessible to the physicians for their patients. The political pressures of special problems

(such as long waits in some areas for access to hip replacement surgery) has led to the application of the universal panacea — more money to buy more orthopedic work — but one gets the feeling this is a reaction — not an action. There is certainly an appreciable difference in the amount of technical work done in the medical care process especially in the hospital setting. The level of medical “care,” however, more than offset this, and there was *no* difference in treatment of a patient because of age.

The “cut backs” are altering patterns of hospital care for everyone with reduced acute stay, etc. The broad community primary care system, however, provides a “safety net” for all. This we are sorely lacking.

There are problems in medicine everywhere.

On insurance for the practice of occupational medicine

To the Editor:

After five years of malpractice insurance coverage by St. Paul's and a spotless record, I was notified by them that they would not renew my policy. They stated that this was based upon a nationwide decision to no longer provide coverage to physicians in the practice of occupational medicine. I, of course, was shocked. However, I now realize that I should not have been, in view of the previous behavior of this company in North Carolina and Florida.

Fortunately, I was able to obtain coverage from Medical Mutual of North Carolina. Their staff has spent considerable time and effort to meet my particular needs. Furthermore, I have direct access to their underwriters and did not have to rely upon everything being transmitted by letter through an agent, as was the case previously. For their peace of mind, North Carolina physicians would be well served to support and use this fine company which is really concerned about the welfare of physicians.

A comment on Dr. Gutman's article

To the Editor:

I write in response to the editorial, *Physicians and Providers*, by Dr. Robert A. Gutman in the September 1987 issue of the North Carolina Medical Journal (NCMJ 48:445). Dr. Gutman's stimulus for the piece was the use of the term “provider” as a self descriptor by an M.D. colleague. I can understand his negative reaction to the term. I too find it unattractive and cold.

If he had stopped there, I would have had no reason to respond, but he proceeds to construct a kind of straw man in which there are two kinds of practitioners: “providers” who are associated with society as a whole, well people, and enrollees in capitated health plans, and “physicians”

who are associated with the “truly sick.” The following amazing question, relating to the former group, follows: “Having spent most of his time caring for the herd of well people and their concerns, and their need for prophylaxis, for immunization, for education, for dietary counseling, for advice on exercise, is he now prepared to be also a physician — prepared either emotionally or educationally?”

I would submit that physicians have successfully straddled that line for centuries, and continue to do so. Dr. Gutman concedes that pediatricians have done so. The general internist and family physician have also done so with distinction. Caring for the “herd of well people” is the highest level of service that a *physician* can provide, and I hope that none will be fooled into thinking that Dr. Gutman's straw man is real!

The long arm of the Editor

To the Editor:

I must tell you about a dream that I had in Scotland: I have already told Ms. Ferejohn about this. During August Mrs. Blythe and I were on vacation in Morar, Scotland, a remote village in Western Scotland. I was having a wonderful time. On the night of August 10th, I had the following dream:

The telephone rings: a serious Steadian voice belonging to Dr. Stead says, “Bill, I need some manuscripts for Learning Experiences from UNC. Why haven't you sent me any?” Blythe — “Dr. Stead I have sent several over to Ms. Ferejohn — perhaps you need to speak to her.” Stead — “It was our impression that these were not submitted as manuscripts for Learning Experiences from UNC.” Blythe — “Well gosh they were sent for that reason.” Stead — “Bill, I think you better get busy and send me some more manuscripts.”

I awoke in a cold sweat and was delighted to realize that I had sent several manuscripts for “Learning Experiences from UNC” and that in fact I was in Scotland and having a wonderful time. The long arm of Eugene Stead is perhaps longer than you realize.

With highest personal regards.

How More Than 3000 Doctors Have Eased The Pain Of Managing A Practice.

If your practice is like a lot of others, you often spend more time on office problems than on the health problems of your patients.

Our one easy-to-use, fully-integrated computer system can take care of billing, provide financial updates, help you market your practice. And give you more time to do what you went to medical school for.

"We've found that Medic saves us many hours of paperwork every week. A couple of hours of work is down to 15 minutes!"

Jeanine Mielke, office manager, Hahn, Hoard & Taub, M.D., P.A., Boca Raton, Florida

This urology practice uses Medic Computer Systems to electronically transmit many Medicare claims every day. A job that once took a large part of the business day is now done in minutes. And that's only one of the ways that Medic saves time on paperwork.

"It's helped our cash flow tremendously!"

Mike Griga, general manager of Mayfield Neurological Institute, Cincinnati, Ohio

Changing the billing system from once a month to once a week is just one way Medic has improved the bottom line of the

nation's largest neurosurgery group.

"Any time we've had a problem, Medic has been immediately responsive. They bend over backwards to suit their customers. It's the best money we have ever spent."

Wynne Vaughan, office manager, Capital Pediatric and Adolescent Center, P.A., Raleigh, North Carolina

We'll do whatever it takes to keep your system working. Day or night. We have a toll-free STAT line to handle questions and problems. And there's a STAT PLUS line from our support center to your system for software updates and diagnoses.

"Our practice has doubled and we have not had to add additional billing personnel. Medic has been able to handle whatever we've asked of it."

Nancy Psimas, office coordinator, Portsmouth Orthopaedic Associates, Portsmouth, Virginia

The Medic system can ease the process of sending statements and reduce the number of uncollected bills. Plus, our easy-to-understand printouts help you keep better track of your financial condition.

"Medic's extensive training program for our staff made it easy to introduce the system. We recommend it highly."

Tessa Horne, administrator, Morgantown Ear, Nose & Throat Clinic, Morgantown, West Virginia

"We love the training program. And the updates they do really help," Ms. Horne said. When a practice brings in over 200 patients a day as this one does, the business office has to run smoothly. "Medic does everything we need. It's great."

So if you want to increase the efficiency, productivity and profitability of your practice, take a look at the Medic Computer System.

Over 3000 physicians in more than 800 practices throughout the U.S. are calling it a minor medical miracle.

In Memoriam

Donald Lewis Croutcher, M.D.

Don Croutcher was born in Berea, Kentucky on June 11, 1939. He attended Berea College. He received his medical school education at the University of Kentucky in 1966 and served a Mixed Internship at Baptist Memorial Hospital in Memphis, Tennessee from 1966-1967. He began his Radiology Residency at the University of West Virginia 1967-1969, followed by further training at the Ochsner Clinic in New Orleans in 1971-1972. In the interim he served in the United States Air force from 1969-1971.

Don became Certified by the American Board of Radiology and Diagnostic Radiology in 1972 and was Certified by the American Board of Nuclear Medicine in 1975. He practiced in a group practice in Dothan, Alabama from 1972 to 1976 where he established and headed a very active Nuclear Medicine Department. In 1976 he moved to Clinton, North Carolina, where he practiced Radiology at Sampson County Memorial Hospital. He established and headed the Nuclear Medicine Division of Radiology while at Sampson Memorial Hospital, and he was active in the Medical Staff, serving as Medical Staff President and on numerous committees as well. He also served as Chairman of the Department of Radiology for a number of years. He was a member of the Board of Directors of PSRO of Eastern North Carolina.

Publications included "Carotid Artery Injury Produced by Blunt Neck Trauma" in the Southern Medical Journal: Volume 68, March, 1975. He also was a member of the Royal Medical Society in England, and he attended a Nu-

clear Medicine Symposium in London sponsored at the Royal Medical Society.

He died on June 4, 1987.

John L. Rouse, III, M.D.
Secretary
Sampson County Medical Society

Caroline Hollingsworth Callison, M.D., M.P.H.

Caroline Callison was born in Charleston, South Carolina, August 20, 1914. Her undergraduate work was at Coker College where she received a B.S. Degree in 1936. She graduated from Medical College of South Carolina with an M.D. Degree in 1939, and received her Masters Degree in Public Health in 1947 from the University of South Carolina at Columbia. She served an internship at Roper Hospital. Dr. Callison was a health officer in Alabama, South Carolina, and Maryland for approximately 20 years. Finally in 1961 she came to North Carolina and spent her final 16 years as a health director in Sampson and Bladen Counties.

Her interests included fishing, and she played an active role in the Episcopal Church in Clinton. She developed a multiphasic clinic while Director of Sampson County Health Department. She served as President of the North Carolina Academy of Preventive Medicine and Public Health in 1968-1969. In 1972-1973 she was President of the North Carolina Conference of Health Directors.

She died on June 17, 1986.

John L. Rouse, III, M.D.
Secretary
Sampson County Medical Society

Continuing Medical Education

Please note: The Continuing Medical Education Programs at Bowman Gray, Duke, East Carolina (ECU) and UNC Schools of Medicine, and Dorothea Dix are accredited by the American Medical Association. Therefore CME programs sponsored or cosponsored by these schools automatically qualify for AMA Category 1 credit toward the AMA's Physician Recognition Award, and for North Carolina Medical Society Category A credit. Where AAFP credit has been obtained, this also is indicated.

ORTHOPEDIC SURGEON: Develop practice in community nestled in mountains of Virginia. Supported by 150+ bed community hospital servicing an area of 75K. Coverage available from other orthopedic plus general surgeons. Offers recreational variety and ex-

cellent living conditions. Strong net guarantee plus benefits. Contact Jim Davis. Tyler & Company, 9040 Roswell Road, Atlanta, GA 30350. Call 404/641-6411.

INTERNIST/FP: Southeast Virginia. Opportunity to develop practice in attractive semirural community. Competitive compensation/benefits package. Coverage provided by nearby 260+ bed hospital and its primary care physicians. Area has exceptional outdoor recreational activities! Contact Jim Davis. Tyler & Company, 9040 Roswell Rd., Atlanta, GA 30350. Call 404/641-6411.

FP, GP, PED

Needed now to work with a unique, internationally respected rural health system network in Kentucky which includes a hospital, satellite clinics, a home health agency and a school of advanced nursing. A regional medical center is within 20 miles. The practice environment is stimulating — physicians and Advanced Registered Nurse Practitioners work in joint practice teams; interaction with students is encouraged; the rural population presents a wide range and intensity of medical problems.

The FP or GP will be expected to share call with specialists and consequently must have particular strength in one of the following areas: Pediatrics, Obstetrics, Emergency Medicine or Internal Medicine.

The setting is in heavily-wooded mountains with a moderate 4-season climate. Seven state parks are within 80 miles.

Superior compensation/benefits package includes a guaranteed salary with incentives and malpractice. Call Deborah Pennington COLLECT at 1-502-897-2566. This is an Equal Opportunity Employer.

PHYSICIANS— PRIMARY CARE CLINIC

In acute and chronic edema due to CHF

FOR PREDICTABLE CONTROL

- **Less potassium loss for a given amount of sodium excretion than with furosemide¹⁻³**
- **Predictable dose response⁴**
- **Diuresis completed hours faster than with furosemide after oral dosing⁵**
- **Better GI absorption^{6,7}**
- **Early evening dosing helps prevent nocturnal dyspnea**

As with all loop diuretics, excessive doses of BUMEX can lead to profound diuresis with water and electrolyte depletion, including hypokalemia, so serum electrolytes should be monitored.

Bumex[®]

bumetanide/Roche

0.5-mg, 1-mg and 2-mg scored tablets; 2-ml ampuls and 2-ml, 4-ml and 10-ml vials (0.25 mg/ml)

BUMEX[®]
(bumetanide/Roche)
0.5-mg, 1-mg and 2-mg scored tablets
2-ml ampuls, 2-ml, 4-ml and
10-ml vials (0.25 mg/ml)

Before prescribing, please consult complete product information, a summary of which follows:

WARNING: Bumex (bumetanide/Roche) is a potent diuretic which, if given in excessive amounts, can lead to a profound diuresis with water and electrolyte depletion. Therefore, careful medical supervision is required, and dose and dosage schedule have to be adjusted to the individual patient's needs. (See under **DOSAGE AND ADMINISTRATION** in complete product information.)

INDICATIONS AND USAGE: Edema associated with congestive heart failure, hepatic and renal disease, including the nephrotic syndrome.

Almost equal diuretic response occurs after oral and parenteral administration of Bumex. If impaired gastrointestinal absorption is suspected or oral administration is not practical, Bumex should be given by the intramuscular or intravenous route.

Successful treatment with Bumex following instances of allergic reactions to furosemide suggests a lack of cross-sensitivity.

CONTRAINDICATIONS: Anuria. Hypersensitivity and in patients in hepatic coma or in states of severe electrolyte depletion. Although Bumex can be used to induce diuresis in renal insufficiency, any marked increase in blood urea nitrogen or creatinine, or the development of oliguria during therapy of patients with progressive renal disease, is an indication for discontinuation of treatment.

WARNINGS: Dose should be adjusted to patient's needs. Excessive doses or too frequent administration can lead to profound water loss, electrolyte depletion, dehydration, reduction in blood volume and circulatory collapse with the possibility of vascular thrombosis and embolism, particularly in elderly patients.

Prevention of hypokalemia requires particular attention in patients receiving digitalis and diuretics for congestive heart failure, hepatic cirrhosis and ascites, states of aldosterone excess with normal renal function, potassium-losing nephropathy, certain diarrheal states, or other states where hypokalemia is thought to represent particular added risk to the patients.

In patients with hepatic cirrhosis and ascites, sudden alterations of electrolyte balance may precipitate hepatic encephalopathy and coma. Treatment in such patients is best initiated in the hospital with small doses and careful monitoring of the patient's clinical status and electrolyte balance. Supplemental potassium and/or spironolactone may prevent hypokalemia and metabolic alkalosis in these patients. In cats, dogs and guinea pigs, Bumex has been shown to produce ototoxicity. Since Bumex is about 40 to 60 times as potent as furosemide, it is anticipated that blood levels necessary to produce ototoxicity will rarely be achieved. The potential for ototoxicity increases with intravenous therapy, especially at high doses.

Patients allergic to sulfonamides may show hypersensitivity to Bumex.

PRECAUTIONS: Measure serum potassium periodically and add potassium supplements or potassium-sparing diuretics, if necessary. Periodic determinations of other electrolytes are advised in patients treated with high doses or for prolonged periods, particularly in those on low salt diets.

Hyperkalemia may occur. Reversible elevations of the BUN and creatinine may occur, especially with dehydration and in patients with renal insufficiency. Bumex may increase urinary calcium excretion. Possibility of effect on glucose metabolism exists. Periodic determinations of blood sugar should be done, particularly in patients with diabetes or suspected latent diabetes. Patients should be observed regularly for possible occurrence of blood dyscrasias, liver damage or idiosyncratic reactions.

Especially in presence of impaired renal function, use of parenterally administered Bumex should be avoided in patients to whom aminoglycoside antibiotics are also being given, except in life-threatening conditions.

Drugs with nephrotoxic potential and bumetanide should not be administered simultaneously. Since lithium reduces renal clearance and adds a high risk of lithium toxicity, it should not be given with diuretics.

Probenecid should not be administered concurrently with Bumex.

Concurrent therapy with indomethacin not recommended.

Bumex may potentiate the effects of antihypertensive drugs, necessitating reduction in dosage.

Interaction studies in humans have shown no effect on digoxin blood levels.

Interaction studies in humans have shown Bumex to have no effect on warfarin metabolism or on plasma prothrombin activity.

Pregnancy: Bumex should be given to a pregnant woman only if the potential benefit justifies the potential risk to the fetus.

Bumetanide may be excreted in breast milk.

Pediatric Use: Safety and effectiveness below age 18 not established.

ADVERSE REACTIONS: Muscle cramps, dizziness, hypotension, headache and nausea, and encephalopathy (in patients with preexisting liver disease).

Less frequent clinical adverse reactions are weakness, impaired hearing, rash, pruritus, hives, electrocardiogram changes, abdominal pain, arthralgia, pain, musculoskeletal pain and vomiting.

Other clinical adverse reactions are vertigo, chest pain, ear discomfort, fatigue, dehydration, sweating, hyperventilation, dry mouth, upset stomach, renal failure, asterixis, itching, nipple tenderness, diarrhea, premature ejaculation and difficulty maintaining an erection.

Laboratory abnormalities reported are hyperkalemia, azotemia, hyperglycemia, increased serum creatinine, hypochloremia, hypokalemia, hyponatremia, and variations in CO₂ content, bicarbonate, phosphorus and calcium. Although manifestations of the pharmacologic action of Bumex, these conditions may become more pronounced by intensive therapy.

Diuresis induced by Bumex may also rarely be accompanied by changes in LDH, total serum bilirubin, serum proteins, SGOT, SGPT, alkaline phosphatase, cholesterol, creatinine clearance, deviations in hemoglobin, prothrombin time, hematocrit, platelet counts and differential counts. Increases in urinary glucose and urinary protein have also been seen.

DOSAGE AND ADMINISTRATION:

Oral Administration: The usual total daily dosage is 0.5 to 2.0 mg and in most patients is given as a single dose.

Parenteral Administration: Administer to patients (IV or IM) with GI absorption problem or who cannot take oral. The usual initial dose is 0.5 to 1 mg given over 1 to 2 minutes. If insufficient response, a second or third dose may be given at 2 to 3 hour intervals up to a maximum of 10 mg a day.

HOW SUPPLIED: Tablets: 0.5 mg (light green), 1 mg (yellow) and 2 mg (peach), bottles of 100 and 500. Prescription Paks of 30, Tel-E-Dose[®] cartons of 100. Imprint on tablets: 0.5 mg—ROCHE BUMEX 0.5, 1 mg—ROCHE BUMEX 1, 2 mg—ROCHE BUMEX 2.

Ampuls, 2 ml, 0.25 mg/ml, boxes of ten.

Vials, 2 ml, 4 ml and 10 ml, 0.25 mg/ml, boxes of ten.

THERE IS
SOMETHING
IN OUR NAME
THAT BRINGS YOU
A FEELING OF
SECURITY.

CRUMPTON COMPANY.

Why do so many NC physicians participate in the Crumpton Plan of Disability Income Protection?

THE ANSWER is the 47 years of successful relationship and personal service at claim time!

Yes, the feeling of security as well as economic advantage in knowing the program is a plan of carefully designed benefits.

The plan is not filled with a lot of "purple duck feathers," but provides income when you are unable to produce — not promises, but performance.

Why not call us today to obtain the latest details for your group practice? We are delighted to offer our broadened portfolio of professional insurance.

Patients Are Now Looking Better Than Ever.

Magnetic Resonance Imaging is the most advanced diagnostic technology of the last 25 years. The quality of MRI images is helping physicians make easier, more accurate diagnoses.

Now, Craven County Hospital, in cooperation with Lenoir Memorial Hospital and Onslow Memorial Hospital, is bringing this technology to more physicians in Eastern North Carolina through MRI Ltd. The MRI unit is housed in a large van and will travel between New Bern,

Kinston, and Jacksonville.

From these sites, it will serve physicians and patients of Craven County, Lenoir Memorial, Onslow Memorial, Beaufort

County, Carteret General, Pitt Memorial, and Wayne Memorial Hospitals.

For more information or to refer patients, call Craven County Hospital at 919-633-8218 or toll free 1-800-682-0276.

Magnetic Resonance Imaging. It's helping patients look better than ever.

PERSONAL CARE PLAN
Of North Carolina

A Subsidiary of Blue Cross and Blue Shield of North Carolina

Before prescribing, see complete prescribing information in SK&F CO. literature or *PDR*. The following is a brief summary.

*** WARNING**

This drug is not indicated for initial therapy of edema or hypertension. Edema or hypertension requires therapy titrated to the individual. If this combination represents the dosage so determined, its use may be more convenient in patient management. Treatment of hypertension and edema is not static, but must be reevaluated as conditions in each patient warrant.

Contraindications: Concomitant use with other potassium-sparing agents such as spironolactone or amiloride. Further use in anuria, progressive renal or hepatic dysfunction, hyperkalemia. Pre-existing elevated serum potassium. Hypersensitivity to either component or other sulfonamide-derived drugs.

Warnings: Do not use potassium supplements, dietary or otherwise, unless hypokalemia develops or dietary intake of potassium is markedly impaired. If supplementary potassium is needed, potassium tablets should not be used. Hyperkalemia can occur, and has been associated with cardiac irregularities. It is more likely in the severely ill, with urine volume less than one liter/day, the elderly and diabetics with suspected or confirmed renal insufficiency. Periodically, serum K⁺ levels should be determined. If hyperkalemia develops, substitute a thiazide alone, restrict K⁺ intake. Associated widened QRS complex or arrhythmia requires prompt additional therapy. Thiazides cross the placental barrier and appear in cord blood. Use in pregnancy requires weighing anticipated benefits against possible hazards, including fetal or neonatal jaundice, thrombocytopenia, other adverse reactions seen in adults. Thiazides appear and triamterene may appear in breast milk. If their use is essential, the patient should stop nursing. Adequate information on use in children is not available. Sensitivity reactions may occur in patients with or without a history of allergy or bronchial asthma. Possible exacerbation or activation of systemic lupus erythematosus has been reported with thiazide diuretics.

Precautions: The bioavailability of the hydrochlorothiazide component of 'Dyazide' is about 50% of the bioavailability of the single entity. Theoretically, a patient transferred from the single entities of triamterene and hydrochlorothiazide may show an increase in blood pressure or fluid retention. Similarly, it is also possible that the lesser hydrochlorothiazide bioavailability could lead to increased serum potassium levels. However, extensive clinical experience with 'Dyazide' suggests that these conditions have not been commonly observed in clinical practice. Angiotensin-converting enzyme (ACE) inhibitors can elevate serum potassium; use with caution with 'Dyazide'. Do periodic serum electrolyte determinations (particularly important in patients vomiting excessively or receiving parenteral fluids, and during concurrent use with amphotericin B or corticosteroids or corticotropin [ACTH]). Periodic BUN and serum creatinine determinations should be made, especially in the elderly, diabetics or those with suspected or confirmed renal insufficiency. Cumulative effects of the drug may develop in patients with impaired renal function. Thiazides should be used with caution in patients with impaired hepatic function. They can precipitate coma in patients with severe liver disease. Observe regularly for possible blood dyscrasias, liver damage, other idiosyncratic reactions. Blood dyscrasias have been reported in patients receiving triamterene, and leukopenia, thrombocytopenia, agranulocytosis, and aplastic and hemolytic anemia have been reported with thiazides. Thiazides may cause manifestation of latent diabetes mellitus. The effects of oral anticoagulants may be decreased when used concurrently with hydrochlorothiazide; dosage adjustments may be necessary. Clinically insignificant reductions in arterial responsiveness to norepinephrine have been reported. Thiazides have also been shown to increase the paralyzing effect of nondepolarizing muscle relaxants such as tubocurarine. Triamterene is a weak folic acid antagonist. Do periodic blood studies in cirrhotics with splenomegaly. Antihypertensive effects may be enhanced in post-sympathectomy patients. Use cautiously in surgical patients. Triamterene has been found in renal stones in association with the other usual calculus components. Therefore, 'Dyazide' should be used with caution in patients with histories of stone formation. A few occurrences of acute renal failure have been reported in patients on 'Dyazide' when treated with indomethacin. Therefore, caution is advised in administering nonsteroidal anti-inflammatory agents with 'Dyazide'. The following may occur: transient elevated BUN or creatinine or both, hyperglycemia and glycosuria (diabetic insulin requirements may be altered), hyperuricemia and gout, digitalis intoxication (in hypokalemia), decreasing alkali reserve with possible metabolic acidosis. 'Dyazide' interferes with fluorescent measurement of quinidine. Hypokalemia is uncommon with 'Dyazide', but should it develop, corrective measures should be taken such as potassium supplementation or increased dietary intake of potassium-rich foods. Corrective measures should be instituted cautiously and serum potassium levels determined. Discontinue corrective measures and 'Dyazide' should laboratory values reveal elevated serum potassium. Chloride deficit may occur as well as dilutional hyponatremia. Concurrent use with chlorpropamide may increase the risk of severe hyponatremia. Serum PBI levels may decrease without signs of thyroid disturbance. Calcium excretion is decreased by thiazides. 'Dyazide' should be withdrawn before conducting tests for parathyroid function. Thiazides may add to or potentiate the action of other antihypertensive drugs. Diuretics reduce renal clearance of lithium and increase the risk of lithium toxicity.

Adverse Reactions: Muscle cramps, weakness, dizziness, headache, dry mouth, anaphylaxis, rash, urticaria, photosensitivity, purpura, other dermatological conditions, nausea and vomiting, diarrhea, constipation, other gastrointestinal disturbances, postural hypotension (may be aggravated by alcohol, barbiturates, or narcotics). Necrotizing vasculitis, paresthesias, icterus, pancreatitis, xanthopsia and respiratory distress including pneumonitis and pulmonary edema, transient blurred vision, sialadenitis, and vertigo have occurred with thiazides alone. Triamterene has been found in renal stones in association with other usual calculus components. Rare incidents of acute interstitial nephritis have been reported. Impotence has been reported in a few patients on 'Dyazide', although a causal relationship has not been established.

Supplied: 'Dyazide' is supplied as a red and white capsule, in bottles of 1000 capsules; Single Unit Packages (unit-dose) of 100 (intended for institutional use only); in Patient-Pak™ unit-of-use bottles of 100.

BRS-DZ:142

In Hypertension*... When You Need to Conserve K⁺

Remember the Unique Red and White Capsule: Your Assurance of SK&F Quality

Serum K⁺ and BUN should be checked periodically (see Warnings and Precautions).

Potassium-Sparing

DYAZIDE®

25 mg Hydrochlorothiazide, 50 mg Triamterene/SKF

Over 20 Years of Confidence

The unique
red and white
Dyazide® capsule:
Your assurance of
SK&F quality.

a product of
SK&F CO.
Carolina, P.R. 00630

Consider the causative organisms...

Ceclor[®]
cefactor

250-mg Pulvules[®] t.i.d. **offers effectiveness against** **the major causes of bacterial bronchitis**

Haemophilus influenzae and *Streptococcus pneumoniae*
(ampicillin-susceptible and ampicillin-resistant)

Note: Ceclor is contraindicated in patients with known allergy to the cephalosporins and should be given cautiously to penicillin-allergic patients.

Penicillin is the usual drug of choice in the treatment and prevention of streptococcal infections, including the prophylaxis of rheumatic fever. See prescribing information.

Ceclor[®] (cefactor)

Summary. Consult the package literature for prescribing information.

Indication: Lower respiratory infections, including pneumonia, caused by *Streptococcus pneumoniae*, *Haemophilus influenzae*, and *Streptococcus pyogenes* (group A β -hemolytic streptococci).

Contraindication:
Known allergy to cephalosporins.

Warnings:
CECLOR SHOULD BE ADMINISTERED CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. PENICILLINS AND CEPHALOSPORINS SHOW PARTIAL CROSS-ALLERGENICITY. POSSIBLE REACTIONS INCLUDE ANAPHYLAXIS.

Administer cautiously to allergic patients. Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics. It must be considered in differential diagnosis of antibiotic-associated diarrhea. Colon flora is altered by broad-spectrum antibiotic treatment, possibly resulting in antibiotic-associated colitis.

Precautions:

- Discontinue Ceclor in the event of allergic reactions to it.
- Prolonged use may result in overgrowth of nonsusceptible organisms.
- Positive direct Coombs' tests have been reported during treatment with cephalosporins.
- Ceclor should be administered with caution in the presence of markedly impaired renal function. Although dosage adjustments in moderate to severe renal impairment are usually not required, careful clinical observation and laboratory studies should be made.
- Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.
- Safety and effectiveness have not been determined in pregnancy, lactation, and infants less than one month old. Ceclor penetrates mother's milk. Exercise caution in prescribing for these patients.

Adverse Reactions: (percentage of patients)
Therapy-related adverse reactions are uncommon. Those reported include:

- Gastrointestinal (mostly diarrhea): 2.5%.
- Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment.
- Hypersensitivity reactions (including morbilliform eruptions, pruritus, urticaria, and serum-sickness-like reactions that have included erythema multiforme [rarely, Stevens-Johnson syndrome] or the above skin manifestations accompanied by arthritis/arthritis and, frequently, fever): 1.5%; usually subside within a few days after cessation of therapy. Serum-sickness-like reactions have been reported more frequently in children than in adults and have usually occurred during or following a second course of therapy with Ceclor. No serious sequelae have been reported. Antihistamines and corticosteroids appear to enhance resolution of the syndrome.
- Cases of anaphylaxis have been reported, half of which have occurred in patients with a history of penicillin allergy.
- As with some penicillins and some other cephalosporins, transient hepatitis and cholestatic jaundice have been reported rarely.
- Rarely, reversible hyperactivity, nerv-

ousness, insomnia, confusion, hypertonia, dizziness, and somnolence have been reported.

- Other: eosinophilia, 2%; genital pruritus or vaginitis, less than 1%; and, rarely, thrombocytopenia.

Abnormalities in laboratory results of uncertain etiology

- Slight elevations in hepatic enzymes.
- Transient fluctuations in leukocyte count (especially in infants and children).
- Abnormal urinalysis; elevations in BUN or serum creatinine.
- Positive direct Coombs' test.
- False-positive tests for urinary glucose with Benedict's or Fehling's solution and Clinistest[®] tablets but not with Tes-Tape[®] (glucose enzymatic test strip, Lilly).

ZOVIRAX[®]
(acyclovir)
CAPSULES

**Prevent genital herpes
recurrences
month after month with
daily therapy.**

(In controlled studies, recurrences were
totally prevented for 4 to 6 months in up to
75% of patients.)

Please see last page of this advertisement for

ZOVIRAX[®] **(acyclovir)** **CAPSULES**

**Help free your
patients from
recurrences.**

Daily therapy

Coping with genital herpes is rarely easy. For some, the worst part is the pain and discomfort of frequent attacks — month after month, year after year. For others, the emotional burden presents a more difficult problem, leading to social isolation, anxiety, and diminished self-esteem.

Prevent or reduce recurrences

Although your patients have to live with herpes, they shouldn't have to suffer. Daily therapy with ZOVIRAX CAPSULES can help free them from the cycle of recurrent genital herpes. For many, one capsule three times a day can suppress recurrences completely while on therapy.

Generally well tolerated

Daily therapy with ZOVIRAX CAPSULES is generally well tolerated. The most frequent adverse reactions reported during clinical trials were headache, diarrhea, nausea/vomiting, vertigo, and arthralgia.

The physical and emotional difficulties posed by genital herpes are unique for each patient. The frequency and severity of recurrent episodes, as well as the emotional impact of the disease, should be considered when selecting daily therapy with ZOVIRAX CAPSULES.

*Please see brief summary of
prescribing information on next page.*

Prevent recurrences month after month*

ZOVIRAX® (acyclovir) CAPSULES

Brief Summary

INDICATIONS AND USAGE: Zovirax Capsules are indicated for the treatment of initial episodes and the management of recurrent episodes of genital herpes in certain patients.

The severity of disease is variable depending upon the immune status of the patient, the frequency and duration of episodes, and the degree of cutaneous or systemic involvement. These factors should determine patient management, which may include symptomatic support and counseling only, or the institution of specific therapy. The physical, emotional and psycho-social difficulties posed by herpes infections as well as the degree of debilitation, particularly in immunocompromised patients, are unique for each patient, and the physician should determine therapeutic alternatives based on his or her understanding of the individual patient's needs. Thus Zovirax Capsules are not appropriate in treating all genital herpes infections. The following guidelines may be useful in weighing the benefit/risk considerations in specific disease categories:

First Episodes (primary and nonprimary infections — commonly known as initial genital herpes):

Double-blind, placebo-controlled studies have demonstrated that orally administered Zovirax significantly reduced the duration of acute infection (detection of virus in lesions by tissue culture) and lesion healing. The duration of pain and new lesion formation was decreased in some patient groups. The promptness of initiation of therapy and/or the patient's prior exposure to Herpes simplex virus may influence the degree of benefit from therapy. Patients with mild disease may derive less benefit than those with more severe episodes. In patients with extremely severe episodes, in which prostration, central nervous system involvement, urinary retention or inability to take oral medication require hospitalization and more aggressive management, therapy may be best initiated with intravenous Zovirax.

Recurrent Episodes:

Double-blind, placebo-controlled studies in patients with frequent recurrences (6 or more episodes per year) have shown that Zovirax Capsules given for 4 to 6 months prevented or reduced the frequency and/or severity of recurrences in greater than 95% of patients. Clinical recurrences were prevented in 40 to 75% of patients. Some patients experienced increased severity of the first episode following cessation of therapy; the severity of subsequent episodes and the effect on the natural history of the disease are still under study.

The safety and efficacy of orally administered acyclovir in the suppression of frequent episodes of genital herpes have been established only for up to 6 months. Chronic suppressive therapy is most appropriate when, in the judgement of the physician, the benefits of such a regimen outweigh known or potential adverse effects. In general, Zovirax Capsules should not be used for the suppression of recurrent disease in mildly affected patients. Unanswered questions concerning the human relevance of *in vitro* mutagenicity studies and reproductive toxicity studies in animals given very high doses of acyclovir for short periods (see Carcinogenesis, Mutagenesis, Impairment of Fertility) should be borne in mind when designing long-term management for individual patients. Discussion of these issues with patients will provide them the opportunity to weigh the potential for toxicity against the severity of their disease. Thus, this regimen should be considered only for appropriate patients and only for six months until the results of ongoing studies allow a more precise evaluation of the benefit/risk assessment of prolonged therapy.

Limited studies have shown that there are certain patients for whom intermittent short-term treatment of recurrent episodes is effective. This approach may be more appropriate than a suppressive regimen in patients with infrequent recurrences.

Immunocompromised patients with recurrent herpes infections can be treated with either intermittent or chronic suppressive therapy. Clinically significant resistance, although rare, is more likely to be seen with prolonged or repeated therapy in severely immunocompromised patients with active lesions.

CONTRAINDICATIONS: Zovirax Capsules are contraindicated for patients who develop hypersensitivity or intolerance to the components of the formulation.

WARNINGS: Zovirax Capsules are intended for oral ingestion only.

PRECAUTIONS: General: Zovirax has caused decreased spermatogenesis at high doses in some animals and mutagenesis in some acute studies at high concentrations of drug (see PRECAUTIONS — Carcinogenesis, Mutagenesis, Impairment of Fertility). The recommended dosage and length of treatment should not be exceeded (see DOSAGE AND ADMINISTRATION).

Exposure of Herpes simplex isolates to acyclovir *in vitro* can lead to the emergence of less sensitive viruses. The possibility of the appearance of less sensitive viruses in man must be borne in mind when treating patients. The relationship between the *in vitro* sensitivity of Herpes simplex virus to acyclovir and clinical response to therapy has yet to be established.

Because of the possibility that less sensitive virus may be selected in patients who are receiving acyclovir, all patients should be advised to take particular care to avoid potential transmission of virus if active lesions are present while they are on therapy. In severely immunocompromised patients, the physician should be aware that prolonged or repeated courses of acyclovir may result in selection of resistant viruses which may not fully respond to continued acyclovir therapy.

Drug Interactions: Co-administration of probenecid with intravenous acyclovir has been shown to increase the mean half-life and the area under the concentration-time curve. Urinary excretion and renal clearance were correspondingly reduced.

Carcinogenesis, Mutagenesis, Impairment of Fertility: Acyclovir was tested in lifetime bioassays in rats and mice at single daily doses of 50, 150 and 450 mg/kg given by gavage. There was no statistically significant difference in the incidence of tumors between treated and control animals, nor did acyclovir shorten the latency of tumors. In *2 in vitro* cell transformation assays, used to provide preliminary assessment of potential oncogenicity in advance of these more definitive life-time bioassays in rodents, conflicting results were obtained. Acyclovir was positive at the highest dose used in one system and the resulting morphologically transformed cells formed tumors when inoculated into immunosuppressed, syngeneic, weanling mice. Acyclovir was negative in another transformation system considered less sensitive.

In acute studies, there was an increase, not statistically significant, in the incidence of chromosomal damage at maximum tolerated parenteral doses of 100 mg/kg acyclovir in rats but not Chinese hamsters; higher doses of 500 and 1000 mg/kg were clastogenic in Chinese hamsters. In addition, no activity was found after 5 days dosing in a dominant lethal study in mice. In 6 of 11 microbial and mammalian cell assays, no evidence of mutagenicity was observed. At 3 loci in a Chinese hamster ovary cell line, the results were inconclusive. In 2 mammalian cell assays (human lymphocytes and L5178Y mouse lymphoma cells *in vitro*), positive responses for mutagenicity and chromosomal damage occurred, but only at concentrations at least 400 times the acyclovir plasma levels achieved in man.

Acyclovir has not been shown to impair fertility or reproduction in mice (450 mg/kg/day, p.o.) or in rats (25 mg/kg/day, s.c.). At 50 mg/kg/day s.c. in the rat, there was a statistically significant increase in post-implantation loss, but no concomitant decrease in litter size. In female rabbits treated subcutaneously with acyclovir subsequent to mating, there was a statistically significant decrease in implantation efficiency but no concomitant decrease in litter size at a dose of 50 mg/kg/day. No effect upon implantation efficiency was observed when the same dose was administered intravenously. In a rat peri- and postnatal study at 50 mg/kg/day s.c., there was a statistically significant decrease in the group mean numbers of corpora lutea, total implantation sites and live fetuses in the F₁ generation. Although not statistically significant, there was also a dose related decrease in group mean numbers of live fetuses and implantation sites at 12.5 mg/kg/day and 25 mg/kg/day, s.c. The intravenous administration of 100 mg/kg/day, a dose known to cause obstructive nephropathy in rabbits, caused a significant increase in fetal resorptions and a corresponding decrease in litter size. However, at a

maximum tolerated intravenous dose of 50 mg/kg/day in rabbits, there were no drug-related reproductive effects.

Intraperitoneal doses of 320 or 80 mg/kg/day acyclovir given to rats for 1 and 6 months, respectively, caused testicular atrophy. Testicular atrophy was persistent through the 4-week postdose recovery phase after 320 mg/kg/day; some evidence of recovery of sperm production was evident 30 days post-dose. Intravenous doses of 100 and 200 mg/kg/day acyclovir given to dogs for 31 days caused aspermatogenesis. Testicles were normal in dogs given 50 mg/kg/day, i.v. for one month.

Pregnancy: Teratogenic Effects: Pregnancy Category C. Acyclovir was not teratogenic in the mouse (450 mg/kg/day, p.o.), rat (50 mg/kg/day, s.c.) or rabbit (50 mg/kg/day, s.c. and i.v.). There are no adequate and well-controlled studies in pregnant women. Acyclovir should not be used during pregnancy unless the potential benefit justifies the potential risk to the fetus. Although acyclovir was not teratogenic in animal studies, the drug's potential for causing chromosome breaks at high concentration should be taken into consideration in making this determination.

Nursing Mothers: It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when Zovirax is administered to a nursing woman. In nursing mothers, consideration should be given to not using acyclovir treatment or discontinuing breastfeeding.

Pediatric Use: Safety and effectiveness in children have not been established.

ADVERSE REACTIONS — Short-Term Administration: The most frequent adverse reactions reported during clinical trials were nausea and/or vomiting in 8 of 298 patient treatments (2.7%) and headache in 2 of 298 (0.6%). Less frequent adverse reactions, each of which occurred in 1 of 298 patient treatments (0.3%), included diarrhea, dizziness, anorexia, fatigue, edema, skin rash, leg pain, inguinal adenopathy, medication taste and sore throat.

Long-Term Administration: The most frequent adverse reactions reported in studies of daily therapy for 3 to 6 months were headache in 33 of 251 patients (13.1%), diarrhea in 22 of 251 (8.8%), nausea and/or vomiting in 20 of 251 (8.0%), vertigo in 9 of 251 (3.6%), and arthralgia in 9 of 251 (3.6%). Less frequent adverse reactions, each of which occurred in less than 3% of the 251 patients (see number of patients in parentheses), included skin rash (7), insomnia (4), fatigue (7), fever (4), palpitations (1), sore throat (2), superficial thrombophlebitis (1), muscle cramps (2), paronychia (1), menstrual abnormality (4), acne (3), lymphadenopathy (2), irritability (1), accelerated hair loss (1), and depression (1).

DOSAGE AND ADMINISTRATION: Treatment of initial genital herpes: One 200 mg capsule every 4 hours, while awake, for a total of 5 capsules daily for 10 days (total 50 capsules).

Chronic suppressive therapy for recurrent disease: One 200 mg capsule 3 times daily for up to 6 months. Some patients may require more drug, up to one 200 mg capsule 5 times daily for up to 6 months.

Intermittent Therapy: One 200 mg capsule every 4 hours, while awake, for a total of 5 capsules daily for 5 days (total 25 capsules). Therapy should be initiated at the earliest sign or symptom (prodrome) of recurrence.

Patients With Acute or Chronic Renal Impairment: One 200 mg capsule every 12 hours is recommended for patients with creatinine clearance ≤ 10 ml/min/1.73 m².

HOW SUPPLIED: Zovirax Capsules (blue, opaque) containing 200 mg acyclovir and printed with "Wellcome ZOVIRAX 200" - Bottles of 100 (NDC-0081-0991-55) and unit dose pack of 100 (NDC-0081-0991-56).

Store at 15°-30°C (59°-86°F) and protect from light.

*In controlled studies, recurrences were totally prevented for 4 to 6 months in up to 75% of patients.

BURROUGHS WELLCOME CO.

Real estate. Now more than ever.

Yes, the Tax Reform Act created changes in the amount of deductions associated with Real Estate. But it has also caused a significant drop in new construction activity. As a result, there has been more demand for existing space, leading to higher rents and increased values. Nowhere has this effect been more prevalent than in the Coastal Resort Areas.

Additionally, the events on Wall Street during October accentuate the need for solid investment strategies. . . .

Real Estate provides tax benefits, capital appreciation, and the peace of mind you need in these changing markets.

REAL ESTATE

913 Ocean Drive

This custom-built oceanfront home was made for pure comfort and shows quality throughout. Constructed by a builder for his family, this home has a terrific sense of detail — from the ceramic baths, marble hearth, large Master Suite with Jacuzzi, and wetbar to the 1350 sq. ft. of decking, 4 bedrooms, 3 baths and upstairs lounge.

1003 Emerald Drive

Open and airy describes this home — and it's waiting for you and your family. Built with an eye for the rental market, this home incorporates many features one would find in a permanent residence. This third row home has excellent ocean and sound views, slate foyer and hearth, fireplace and over 1600 sq. ft. of decking. May be purchased furnished — 3 bedrooms, 2½ baths.

102 Sandbur Drive

Make a splash at the beach in style! This contemporary, spacious ± 1500 ft²/side *duplex* will appeal as both year 'round home or rental property. This flexible floor plan sports 3 bedrooms and 2½ baths per side. Private decks, exterior showers, and ocean views are only a few of the amenities. Both sides are furnished for immediate occupancy.

As long as people continue to appreciate the finer life,
COAST REALTY AND CONSTRUCTION COMPANY
will be there to assist.

Specializing in custom construction, we can assist in finding your building lot or investment property. For further information about these and other fine properties, please contact:

Pneumocystis Carinii in the AIDS Patient

Nancy G. Henshaw, M.P.H., Ph.D.

Pneumocystis carinii is the most important opportunistic infection occurring in patients with AIDS.¹ In fact, pneumocystosis is the index diagnosis for one-half of all AIDS patients, and occurs in 80-85% of patients during the course of the disease.² *P. carinii* is the most common organism found in the lungs of AIDS patients, accounting for about 90% of all lung infections.³ Other lung pathogens are present simultaneously in about one-third of cases.³

P. carinii is thought to be a ubiquitous saprophyte in nature, and of worldwide distribution. It maintains itself in the immunocompetent populations but causes clinical disease only in the immunosuppressed. The organism is a unicellular eukaryote and classified most often with the protozoa. It has two major forms: a vegetative form, the trophozoite; and a thick walled form, the cyst.

Trophozoites are very irregular in shape with numerous lobes and tubular extensions or filopodia (figure 1). These forms are 1-5µm in size, containing one nucleus with a single or double membrane which is often poorly defined, a nucleolus, a few mitochondria with poorly developed lamellar cristae, loose endoplasmic reticulum, free ribosomes, glycogen granules, and vacuolar spaces limited by thin fragments of membrane.

The cysts measure 5-7µm in diameter and have a thick trilayered cell wall (figure 1). There is a maximum of eight intracystic bodies formed inside a cyst. Each intracystic body has a nucleus, mitochondrion, and a few lamellae of rough endoplasmic reticulum.

Campbell⁴ proposed the most widely accepted life cycle for *P. carinii*. The trophozoite may undergo several replications by binary fission before developing a thick trilayered cell wall. Such forms, called precysts, develop into cysts. The intracystic bodies contained in the cyst erupt from the cyst wall and become trophozoites. A sexual cycle has not been proven for *P. carinii*, although one group of investigators has shown evidence for meiosis and probable sporogony in cysts.⁵ It is generally thought that the cyst is the most likely source of infection, and the disease is transmitted by the respiratory route.

The organisms reside in the lung alveoli, adhere to Type

Figure 1. Electron micrograph demonstrating *Pneumocystis carinii* organisms adherent to the alveolar Type I epithelial cell. The trophozoites (T) are irregular in shape and interdigitate with the surface of the host epithelial cell (arrows). The cyst (C) has a thick cell wall and three intracystic bodies (ICB) visible. (x22000)

I alveolar epithelial cells,⁶ and cause a diffuse alveolar infiltrate (figure 2a, next page). They are not found adherent to the airway epithelium, including the epithelium of the terminal bronchioles, nor are they intracellular. In severe infections, such as those seen in AIDS patients, *P. carinii* organisms line the alveolar epithelial cells and prevent gaseous exchange (figure 1). In terminal stages of infection, there is desquamation of alveolar cells. Large numbers of organisms, sluffed alveolar cells, proteinaceous fluid, and foamy macrophages fill the alveolar air spaces.

For a definitive diagnosis, *P. carinii* must be demonstrated in lung tissue or alveolar fluid derived from the lungs. No serological test at present is both sensitive and specific enough to make the diagnosis of *P. carinii*. Obtaining an adequate specimen for diagnosis is often hazardous to the patient, since virtually all patients with suspected *P. carinii* pneumonitis are gravely ill. The exact method used depends largely upon the experience and expertise of the specialists at each medical center as well as the age and medical condition of the patients involved. The standard procedure is open lung biopsy; however, this procedure is being replaced

From the Department of Pediatrics-Infectious Disease, Duke University Medical Center, P.O. Box 2951, Durham 27710.

Figure 2. a) Hematoxylin- and eosin-stained lung section infected with *Pneumocystis carinii* showing alveolar infiltrates of macrophages, cellular debris, and proteinaceous fluid. (x2500)

b) Toluidine Blue O stained alveolar lavage fluid. Cysts (arrow) stain purple; host tissue stains blue. (x4500)

c) Methenamine silver stained lung section infected with *Pneumocystis carinii*. Cysts (arrow) are stained black; lung tissue stains green. (x2500)

d) Giemsa stained lung biopsy touch preparation. The cyst (arrow) with eight intracystic bodies visible is diagnostic. Trophozoites (T) are also visible. (x4500).

in many medical centers by transbronchial biopsy or bronchoalveolar lavage.⁷

Diagnosis of pneumocystosis is more readily made in patients with AIDS than in patients with immunosuppression due to other causes because of the larger number of organisms that are present.¹ Organisms are so abundant in patients with AIDS that induced sputum can often be used to make the diagnosis. Induced sputum yielded organisms in 5-10% of non-AIDS patients with *P. carinii* and in 61% of AIDS patients with *P. carinii*.^{8,9}

The successful diagnosis of *P. carinii* depends on two factors: the collection of the proper sample; and an appropriate histochemical stain to distinguish *P. carinii* from cellular material.⁷ For rapid screening, a special cell wall stain is usually employed to visualize the cyst cell wall, such as Toluidine Blue O (figure 2b), or methenamine silver (figure 2c). These stains also stain fungal cell walls; therefore, knowledge of the appearance and morphology of *P. carinii* on these stains is necessary. For confirmation of *P. carinii*, the Giemsa stain is customarily used (figure 2d). All the stages of *P. carinii* are visualized, trophozoite and cyst. The cyst with eight intracystic bodies is diagnostic for *P. carinii*.

For the treatment of pneumocystosis, pentamidine isethionate and trimethoprim-sulfamethoxazole (TMP-SMZ) have equivalent efficacies.¹⁰ In human studies, TMP-SMZ has been shown to be generally less toxic than pentamidine,¹¹ therefore, since the late 1970s TMP-SMZ has been employed as the treatment of choice for pneumocystosis. However, AIDS patients have a higher incidence of toxic reactions to TMP-SMZ than other immunosuppressed patients. Most AIDS patients are administered TMP-SMZ first,

with pentamidine being reserved for patients who do not respond to therapy either because of severe adverse reactions or because of progressive disease. Alternate drugs for treatment for *P. carinii* are needed, however. On follow-up bronchoscopy, persistent *P. carinii* has been observed as long as three weeks following treatment in two-thirds of AIDS patients.¹⁰ This figure is much higher than that reported for other immunosuppressed populations.¹⁰ Hydroxystilbamidine, TMP-dapsone (a sulfone), and difluoromethylornithine are some of the drugs that are currently under investigation for treatment of *P. carinii*.

In summary, with the advent of AIDS, *Pneumocystis carinii* has become an important cause of pneumonia. Such a disease manifestation is evidence of severe immunodeficiency. Proper diagnosis requires a high index of suspicion on the part of the physician, an appropriate specimen, and laboratory expertise. Currently, much ongoing research is addressing the areas of rapid diagnosis and development of better therapy and prophylaxis. ■

How More Than 3000 Doctors Have Eased The Pain Of Managing A Practice.

If your practice is like a lot of others, you often spend more time on office problems than on the health problems of your patients.

Our one easy-to-use, fully-integrated computer system can take care of billing, provide financial updates, help you market your practice. And give you more time to do what you want to medical school for.

"We've found that Medic saves us many hours of paperwork every week. A couple of hours of work is down to 15 minutes."

Jeanine Mielke, office manager, Hahn, Hoard & Taub, M.D., P.A., Boca Raton, Florida

This urology practice uses Medic Computer Systems to electronically transmit many Medicare claims every day. A job that once took a large part of the business day is now done in minutes. And that's only one of the ways that Medic saves time on paperwork.

"It's helped our cash flow tremendously"

Mike Griga, general manager of Mayfield Neurological Institute, Cincinnati, Ohio

Changing the billing system from once a month to once a week is just one way Medic has improved the bottom line of the

nation's largest neurosurgery group.

"Any time we've had a problem, Medic has been immediately responsive. They bend over backwards to suit their customers. It's the best money we have ever spent"

Wynne Vaughan, office manager, Capital Pediatric and Adolescent Center, P.A., Raleigh, North Carolina

We'll do whatever it takes to keep your system working. Day or night. We have a toll-free STAT line to handle questions and problems. And there's a STAT PLUS line from our support center to your system for software updates and diagnoses.

"Our practice has doubled and we have not had to add additional billing personnel. Medic has been able to handle whatever we've asked of it."

Nancy Psimas, office coordinator, Portsmouth Orthopaedic Associates, Portsmouth, Virginia

The Medic system can ease the process of sending statements and reduce the number of uncollected bills. Plus, our easy-to-understand printouts help you keep better track of your financial condition.

"Medic's extensive training program for our staff made it easy to introduce the system. We recommend it highly."

Tessa Horne, administrator, Morgantown Ear, Nose & Throat Clinic, Morgantown, West Virginia

"We love the training program. And the updates they do really help," Ms. Horne said. When a practice brings in over 200 patients a day as this one does, the business office has to run smoothly. "Medic does everything we need. It's great."

So if you want to increase the efficiency, productivity and profitability of your practice, take a look at the Medic Computer System.

Over 3000 physicians in more than 800 practices throughout the U.S. are calling it a minor medical miracle.

For professionals, a major disability or illness can be financial disaster.

A disability income protection plan from Connecticut Mutual replaces earnings lost because of disability.

Our plan includes:

- high benefit limits that replace more of your income;
- special reduced rates for non-smokers;
- proportionate benefits when you can only work part-time but still

need a full-time income;

- the ability to increase your basic policy benefit as your income increases, regardless of your health;
- reimbursement for vocational and educational expenses during rehabilitation;
- an "Own Occupation" rider that pays full benefits if you are unable to perform the main duties of your own occupation, even if you earn income from a different job or business;
- we can also pay dividends that

reduce the cost of your coverage.

Call today to find out how we can custom design a Blue Chip protection plan to keep your income healthy.

Arsenic Poisoning and Seizures

Thomas L. Ortel, M.D., Ph.D., Camille L. Bedrosian, M.D., and David L. Simel, M.D.

A "diagnosis" may not always benefit a patient and may, at times, produce harm rather than good. An incorrect diagnosis that leads to incorrect treatment ignores the basic illness and introduces all the potential harmful effects from improper medications. We present a patient with a complex multi-system disorder; because each of his problems were approached separately, with special attention directed to his seizure disorder, the single diagnosis unifying many multiple symptoms was missed.

Our patient was a 72-year-old crop farmer who gradually developed personality changes, intermittent confusion, difficulties with memory, headaches, weight loss, and predominantly left-sided weakness. He sustained a possible tonic-clonic seizure in late 1985, but first went to a physician three months later following a second seizure. A computed tomogram (CT) of the head was normal, but an electroencephalogram (EEG) revealed irregular, sharp activity in the left anterior temporal area. He was only given digoxin for atrial fibrillation.

He did poorly and was re-admitted two months later for severe nausea and vomiting, dehydration, inability to stand, episodic staring spells, and tingling in his arms. The following tests were normal: 24-hr urine for vanillylmandelic acid, free catecholamines and metanephrines, thyroid function tests, cortrosyn stimulation test, serum protein electrophoresis, sedimentation rate, anti-nuclear antibodies, complete blood count, abdominal CT scan, 24-hr Holter monitor, and a resting multigated angiogram. A repeat EEG revealed epileptiform discharges involving both anterior temporal areas. CT scan of the cervical spine revealed cervical spondylosis. He was diagnosed as having temporal lobe seizures and was treated with tegretol.

His symptoms worsened six months later, when he developed recurrent nausea and vomiting, dizziness, chills, headache, and had new ST-T wave changes on his electrocardiogram. A myocardial infarction was ruled out by negative cardiac isoenzymes. He again underwent an extensive

neurologic evaluation, including a normal head CT, normal cerebral arteriogram, and normal cerebrospinal fluid studies. EEG again revealed epileptiform discharges in the anterior temporal location, right more than left. The serum vitamin B₁₂ and folate levels were normal. A 24-hr. urine study for porphyrins was reportedly positive, but a serum Δ -amino-levulinic acid level was "normal." Esophagogastroduodenoscopy revealed possible extrinsic compression of the gastric antrum. He was treated with tegretol, dilantin, and digoxin.

He was first evaluated at our hospital for his seizure disorder and progressive decline in late 1986. A repeat head CT was normal, and a repeat EEG revealed right-sided irregularities without ongoing seizure activity. A magnetic resonance image of the head was normal. A complete blood count revealed a hemoglobin of 10.6 gm/dl and a white count of 2600/mm³ (49% neutrophils, 41% lymphocytes, 10% monocytes). The reticulocyte count was 6.1%, Coombs' test was negative, and a screen for paroxysmal nocturnal hemoglobinuria was normal. The serum ferritin was 181 ng/ml (normal, 31-294 ng/ml). His tegretol was discontinued because of presumed bone marrow toxicity.

His condition stabilized until two months later when he developed increased discoordination, confusion, and recurrent seizures. He returned to our hospital with a fever of 101°F in mild respiratory distress. He was thin and had bitemporal wasting, and the skin was diffusely hyperpigmented with hyperkeratotic changes involving the soles of the feet (see figure 1). He was completely oriented with an intact short-term memory, but he was confused concerning recent events. His strength was slightly decreased, the left side more than the right. Pinprick sensation and light touch were diminished over the distal arms and legs, left greater than right. His deep tendon reflexes were diminished diffusely. His hemoglobin had decreased to 7.1 gm/dl, and the white count was 2100/mm³ with 68% neutrophils, 20% lymphocytes, and 12% monocytes; the peripheral blood film also revealed anisocytosis and basophilic stippling. The sodium was 141 mmol/L, potassium 3.9 mmol/L, chloride 111 mmol/L, and carbon dioxide 17 mmol/L.

The patient's blood and sputum were cultured, a lumbar puncture was performed, and he was started on mezlocillin

From the Department of Internal Medicine, Durham Veterans Administration Medical Center, and Duke University Medical Center, Durham 27710. Reprint requests: Thomas L. Ortel, M.D., Ph.D., Box 3422, Duke University Medical Center, Durham 27710.

Figure 1. Hyperkeratotic changes on the soles of the patient's feet. The darker markings in the arches of his feet were present on admission, and neither he nor his wife knew their etiology.

and gentamicin. Although the blood, sputum, and cerebrospinal fluid cultures revealed no organisms, the patient clinically improved with intravenous antibiotics. Bone marrow aspiration revealed the marrow to be slightly hypocellular with occasional erythroid nuclear karyorrhexis, but myeloid:erythroid ratio, megakaryocytes, and bone marrow iron staining were normal. An electromyogram revealed a moderately severe sensorimotor neuropathy with axonal and demyelinating changes in the upper and lower extremities. A cortosyn stimulation test was again normal and a repeat 24-hour urine for porphyrins was negative.

A 24-hour urine sample was negative for arsenic, lead, and mercury; however, pubic hair and nail clippings analysis revealed the presence of arsenic at a level of 71.1 ug/gm of tissue (upper normal <10 ug/gm). He was begun on dimercaprol (British anti-Lewisite), 300 mg every four hours intramuscularly for two days, followed by 300 mg intramuscularly every 12 hours for an additional eight days of therapy. A repeat 24-hour urine arsenic assay was elevated (58 ug/L) two days after initiating chelation therapy. Penicillamine (25 mg/kg every six hours) was started after completing the course of dimercaprol.

Although many of his symptoms improved with therapy, he still has an occasional seizure, and the dysesthesias in his feet persist. The source of his arsenic intoxication is as yet unidentified, despite examination of his farm by the North Carolina Department of Pesticide Toxicology. The sheriff's department has been notified.

Discussion

Our patient presented with a complex multisystem disorder characterized by a chronic progressive decline punctuated by intermittent acute exacerbations. He was hospitalized on several occasions, and, despite extensive evaluation, the forest was missed as each tree was carefully examined. A malignancy was suspected but could not be proven, and the diagnosis of temporal lobe epilepsy could not explain all of his symptoms. Although arsenic intoxication was not suspected in our patient initially, a review of his case reveals that most of his symptoms, if not all, can be directly attributed to acute and chronic arsenic exposure.

Arsenic is a common environmental toxin that is present naturally in soil, water, and air.¹ Arsenic is also released into the environment from various anthropogenic sources, predominantly industrial and agricultural.¹ Chemically, arsenic resembles phosphorus, and arsenic anions can substitute for phosphate in various reactions. It can exist in three possible oxidation states (metalloid [0], trivalent [arsenite], and pentavalent [arsenate]), and it is found in both organic and inorganic forms. These forms vary in their potency, with arsenite being more toxic than arsenate, and the inorganic arsenicals more toxic than the organic.^{1,2} In fact, certain organoarsenicals have been used as feed additives for poultry and other livestock to promote growth and weight gain.² Although the different states vary in their individual potencies, the mechanism of arsenic toxicity is similar for all, involving its ability to combine with thiol groups in the tissues.³

Arsenic has been implicated in human poisonings and deaths, both accidental and intentional, throughout recorded history. The "Staffordshire beer epidemic" of 1900 resulted from the use of arsenic-contaminated sugar in the production of beer, causing 6,000 poisonings and about 70 deaths.⁴ Powdered milk contaminated with arsenic trioxide resulted in over 12,000 poisonings and 128 deaths in Japan in 1955-1956.¹ In addition to accidental exposures, arsenic has been used extensively by poisoners, who have favored it for its lack of taste or odor. Lucrezia Borgia used arsenic to poison "unwelcome" banquet guests, and hair clippings from Napoleon revealed intermittent arsenic exposure prior to his death.³ Although it is infrequently used as a homicidal agent at present due to sensitive tests for detecting its presence, 56 confirmed cases of arsenic poisoning were diagnosed at Duke Medical Center from 1970 to 1980.⁵

Acute intoxication with arsenic initially produces a metallic taste and a garlic-like odor to the breath. This is fol-

lowed by the abrupt development of severe nausea, vomiting, colicky abdominal pain, and profuse diarrhea. In severe cases, this can proceed to hypovolemia, acute renal failure, cardiac failure, cardiac dysrhythmias, cerebral edema, coma, and death. In addition to the above symptoms, exposure to arsine (AsH_3), a highly poisonous gas produced during the smelting and refining of certain metals, produces a rapid hemolysis, resulting in an elevated plasma hemoglobin and hemoglobinuria.⁶ On several occasions, our patient was hospitalized with the acute onset of severe nausea and vomiting, dehydration, and an exacerbation of his neurologic symptoms.

Chronic arsenic intoxication is protean in its manifestations, affecting virtually every organ system in the body. In general, the patient may present with chronic weakness, anorexia, weight loss, hoarseness, lassitude, and a variable degree of dementia, all of which were demonstrated by our patient. Cutaneous manifestations are non-specific, but include a coppery pigmentation of the skin due to the deposition of melanin and hyperkeratoses of the palms of the hands and soles of the feet (see figure 1). Transverse white bands crossing the nails that do not blanch with pressure are referred to as Aldrich-Mee's lines.

Hematologic manifestations include the development of anemia, leukopenia, and frequently thrombocytopenia; a mild absolute eosinophilia commonly occurs.⁷ Peripheral erythrocytes develop coarse basophilic stippling as well as multinucleated forms, and karyorrhexis, representing accelerated pyknosis of the normoblast nucleus, is seen in the bone marrow.^{7,8} Our patient's anemia and leukopenia were initially attributed to therapy with tegretol; in retrospect, all of his hematologic abnormalities can be attributed to chronic arsenic exposure.

Arsenic also has chronic effects on the gastrointestinal tract, producing stomatitis, chronic diarrhea, and malabsorption, as well as hepatotoxic effects, including fatty infiltration, central necrosis, and eventual cirrhosis.³ Cardiac effects include conduction abnormalities, producing typical electrocardiographic changes including prolonged atrio-ventricular and intraventricular conduction times as well as prolongation of the QT interval with abnormal ventricular repolarization.² Our patient presented with atrial fibrillation, and, on one occasion, his electrocardiogram suggested an acute myocardial infarction. Lastly, exposure to arsenicals has been associated with carcinogenesis, most commonly skin cancers such as Bowen's disease and squamous cell carcinomas.²

Arsenic poisoning affects both the central and the peripheral nervous system, but its effects on the latter predominate. Typical features of arsenical neuropathy usually develop within one to three weeks after exposure and include numbness and paresthesias, diminished sensation, and reduced muscle power, all of which are more pronounced distally.⁹ Foot and wrist drop are common, and deep tendon reflexes are frequently absent or diminished. Nerve conduction studies have demonstrated diminished or absent

evoked sensory potentials with prolongation of both sensory and motor conduction, and histologic studies have shown segmental demyelination as well as axonal degeneration.¹⁰ By the time our patient was finally diagnosed with arsenic intoxication, his peripheral dysesthesias had progressed to the point that he was barely able to walk due to the severe pains in his feet.

Symptoms pertaining to involvement of the central nervous system may occur in 15-20% of patients; these symptoms are usually mild and quickly respond to therapy.³ In more severe cases, on the other hand, there have been reports of toxic delirium, coma, and seizures. Convulsions are felt to represent a clinical manifestation of encephalorrhagia ("brain purpura"), with pericapillary hemorrhage and degeneration serving as foci for seizure activity. On several occasions, one of the symptoms our patient developed following a presumed acute exposure to arsenic was an exacerbation of his seizure disorder; it is not known whether this represented a primary effect of the arsenic on his central nervous system or a possible unmasking of a subclinical seizure focus. In general seizures are rarely seen with arsenic intoxication, and their presence usually signifies a preterminal event.

Management of acute arsenical intoxication includes gastric lavage to remove residual arsenic in the stomach and administration of a cathartic to decrease intestinal absorption of arsenic; intravascular volume is maintained with intravenous fluids. In arsine poisoning, supportive management may include exchange transfusion for the hemolysis and hemodialysis for acute renal failure. Chelating agents, such as dimercaprol (British antilewisite, 2,3-dimercaptopropanol) and D-penicillamine, both thiol-containing metal chelators, provide a specific mechanism for inactivating toxic arsenicals.³ Dimercaprol was first developed during World War II as an antidote for the German war-gas lewisite (chlorvinylchlorarsine, $\text{C}_2\text{H}_2\text{Cl}_2\text{As}$), which combines the vesicant effects of mustard gas with the toxic action of arsenic. Dimercaprol is most useful in the treatment of acute arsenic poisoning, except for arsine exposure, on which it has little effect. Although the benefit of dimercaprol in chronic intoxication is unclear, a therapeutic trial is usually indicated since partial reversal of some of the manifestations has been reported.³ Dimercaprol is essentially ineffective in the treatment of arsenical neuropathy unless it is initiated within hours of ingestion.⁹ D-penicillamine is a monothiol chelating agent used in the treatment of Wilson's disease for its ability to chelate copper; it has also been demonstrated to be efficacious in the treatment of arsenic poisoning, although it is felt to be less effective than dimercaprol in reversing the toxic effects of arsenic.³

In summary, our patient developed chronic arsenic intoxication as a result of intermittent acute exposure. His original diagnosis of temporal lobe epilepsy could not explain all of his symptoms, and may have contributed to the delay before the correct diagnosis was actually made. In fact, it is unclear to us whether his seizures can be rightfully

connected to arsenic exposure or whether they represent a separate, unrelated process. ■

Now America's oldest professional liability insurer has come to North Carolina.

The newest professional liability insurer in North Carolina is the oldest in the nation. The Medical Protective Company pioneered the concept of professional protection before the turn of the century and has been serving doctors exclusively ever since. Through good times and bad.

With the current liability crisis escalating, you need to take a close look at your coverage and the company that stands behind it. Then take a close look at us. You'll see we carry the highest

rating from A.M. Best, the firm that tracks the financial stability of insurance companies nationwide. Beyond that, you'll find complete protection at premium rates that are likely lower than you're currently paying. Plus the personal attention and claims prevention assistance you deserve.

Contact Stu Mitchelson today at 704/541-8020. He's the oldest company's representative in its newest state. And he's here to serve you.

THE

MEDICAL PROTECTIVE COMPANY

PHYSICIANS

You'll Get More From The Guard Than You Can Imagine.

A unique and rewarding role.

The moment you entered the field of medicine, you made a commitment to helping people. And they, in turn, looked to you with a trust and respect that's afforded few other professions. It was that special relationship that instilled in you a strong sense of community: an awareness of our dependence on one another and of how vital your position was. It was a proud feeling. You'll never lose it.

But you can build on it. You can experience an even greater sense of community as a member of the Army National Guard. Our whole

being is based on the idea of community. And we're unique among the services because of it.

Our members aren't full-time military people. They're citizen soldiers who serve their own hometowns, cities, and states. They help their neighbors in times of crisis and their country in its times of need. And through the Guard they develop a feeling of purpose of involvement that gives their lives extra importance.

Right now, the Army National Guard *needs you*. We need your

skills, your expertise, your insights. You're a valuable professional, so we recognize your need for more substantial benefits. And there are plenty of them.

But more than anything, we believe you're ready for something that'll give you an added pride and worth. Something that'll put you in touch with people as never before.

It's the chance to realize a greater sense of community. We don't believe you can find a more meaningful avocation.

Gaining a new respect among new people.

When you spend your time with us, you'll discover more than a job. You'll discover a fellowship. The Guard is a whole community of talented colleagues working together, exchanging ideas, and establishing friendships. It's a peer association you'll look forward to. One that goes beyond the usual medical organizations

and societies you might belong to because it's part of a highly charged, active military environment and has its own very distinct challenges and rewards.

Once you enter the Army National Guard, you'll be appointed a commissioned officer to a rank commensurate with your training and experience.

You'll also become eligible for one of the best retirement programs anywhere. And in this day and age, that's one nest egg that's becoming increasingly difficult to establish.

When you join the Army Guard you give up just a small part of your time, but you get so much in return. And there's more.

The opportunity to further your education in the classroom and the field.

As a physician, the continuance of your education is vital to your personal and professional growth. You need to attend medical conferences and learn new procedures. In the Guard, you can do just that. And be paid for it.

For your annual training, you may be able to attend approved civilian medical conferences and seminars in order to meet your

continuing education requirements. It doesn't always have to be done in one block, either. The 15 days may be performed in separate increments, as planned and coordinated by the unit commander to fulfill the National Guard requirement and to accommodate your professional schedule.

There are other ways you can perform annual training. How

about establishing and manning a field hospital? This comes under Site Support, and it's the kind of training that requires your unit to travel to a camp and actively practice the skills needed to meet real Army Guard emergencies. It's a lot of work, but a lot of excitement, too.

NORTH CAROLINA

Office of the Adjutant General
North Carolina National Guard, Attn: AMEDD

Outreach in Chatham County

John W. Hatch, Dr.P.H.

Access to and availability of health care services among black people living in rural communities in North Carolina has improved vastly over the past two decades. While health status has also improved during this period, the rate of preventable and controllable morbidity and mortality due to cardiovascular disease and poor infant and maternal care remain unacceptably high.¹ It is believed that most appropriate utilization of existing health care resources will have substantial impact on this problem.² The challenge rests in identifying and implementing strategies for changing selected patterns of health-directed and health-related behavior and for gaining support from health professionals.

In 1979 the author, assisted by two graduate students, initiated a community health education project in Chatham County in cooperation with black churches and health care professionals in the county. Since then, the model we developed in Chatham County has influenced health promotion efforts in three major denominations serving black people in the Carolinas. The General Baptist state convention sponsors an office of Health and Human Services through its central administrative offices in Raleigh. During the past five years the program has trained nearly 1,000 volunteers who encourage prevention through behavior change and more appropriate utilization of existing health care resources. The convention serves over 400,000 Black Carolinians through a network of 1,700 churches. African Methodists of the Cape Fear Conference, serving 13 counties in the eastern region of the state, provide health advocacy training to clergy and lay volunteers through the Shaw-Speaks Center in Wilmington and centrally located churches in their service area. United Methodist in South Carolina are training part-time paid coordinator/organizers to work with communities and churches for improved maternal and child health and cardiovascular health. A pilot program in Bamberg County will be replicated in other regions of the state. These programs are open to churches without regard to denomination or race. Health care professionals provide services without cost.

From Department of Health Education, School of Public Health, Rosenau Hall 201H, University of North Carolina, Chapel Hill 27514. The project described was supported by a grant under Title I of the Higher Education Act of 1956.

Our Experience

Conversations with community leaders confirmed our concern that many people were not utilizing health care resources in ways likely to improve health status. Socioeconomic change had come rapidly. In recent years, a physician who had been in practice in the county seat for over 40 years closed shop, tenant farming declined rapidly over the past 15 years, schools desegregated, and women entered the wage-paying labor force in large numbers. Crossroads grocery had not survived competition with the supermarket.

Notwithstanding the increased accessibility of health care resources because of better work-related benefits, Medicaid, and Medicare, coupled with reduction of racial barriers, people's general knowledge, attitudes and behavior toward health care services seemed little changed. We began by seeking out community leaders, informing them of our concerns, and asking if they felt a need for improved access to health care resources. Our next question was: "Are there people willing to make a commitment of time toward helping others?" We knew that the helping ethos was deeply imbedded in the rural church, and selected them as point of entrée into the community.

Based on these observations, a demonstration project was designed and implemented, with the overall goal of strengthening the role of indigenous helping networks in the following three areas:

- 1 Promoting preventive health behavior.
- 2 Matching people experiencing health problems with appropriate resources, both lay and professional.
- 3 Helping community members toward more appropriate utilization of health care services.

The program objectives were:

- 1 To identify and train lay persons to serve as health information and resource coordinators within their respective churches, in order to increase by 20% the number of people in the group able to give proper information on risks and appropriate interventions (e.g., self-help/advocacy, resources identification and referral) for the conditions of: hypertension; diabetes; and pregnancy; plus two or three other conditions to be determined by the participants.

2 To provide a forum where participants would develop strategies and plans and serve as catalysts in strengthening their own churches' role in promoting and being supportive of positive health behavior.

Initial contacts were made with pastors and church leaders through one-to-one conversation and small group sessions. We told them of our concern about the higher rate of infant mortality and the persistence of large numbers of cases of uncontrolled hypertension and poorly controlled diabetes in the black adult population in Chatham County.

Discussions focused on actions that churches could take to help improve the health of the community. Pastors and church leaders were encouraged to raise questions and to identify and discuss other health concerns. While our intervention targeted promotion of maternal and child health and the prevention and control of diabetes and hypertension, we agreed to offer additional sessions on other topics when justified by interest, contingent on identification of technical resource persons willing to volunteer their services.

Churches electing to participate were asked to select three persons for training as health advocates with the understanding that training would entail a minimum of 20 contact hours offered in two-hour sessions once a week over a 10-week period. Those certified as health advocates would be required to pass three examinations with a score of 70% or higher. On completion of training, health advocates were expected to know the following:

- 1 How their community compared with others in maternal and infant health, and in the prevalence of diabetes and hypertension, including the percentage of cases not controlled.
- 2 The primary reasons for disproportionately high levels of preventable morbidity and mortality.
- 3 Availability of institutional and professional health services and related resources.
- 4 Action the individual, family and community should take toward prevention and control of problems related to diabetes, hypertension and maternal and child health.
- 5 Specific ways for individuals to share newly gained knowledge with family and friends, including counseling, referral, and organizing education and screening opportunities for special groups.

In selecting volunteers, congregations were asked to consider: (1) previously demonstrated willingness to help others; (2) stability, with demonstrated success in living and with plans to remain in the community for at least two years after training; (3) ability to follow through on assigned tasks; (4) the level of trust and respect for the individual on the part of various age, sex, family and friendship groups in the community; (5) personality conducive to effective communication with neighbors and professionals; and (6) additional characteristics the congregations saw as important to doing the job.

Our belief in helping communities increase their self-reliance and ability to act in their own interest guided our

efforts to improve relationships with local health service resources. We knew that the institutional and professional resources needed to reduce excess morbidity and mortality existed in the community. They included the public health department, a community hospital, a comprehensive community health center, social services, a community action program, and private practitioners. The next challenge was to inform them of the project and request their involvement as presenters for technical portions of the training.

Several persons from the group of community advisors were asked to recommend physicians they perceived as likely to respond positively to the project. Initially, I doubted private practice physicians would respond to an unproven project directed by a health educator that would require about four hours of time. Tasks included a pre-planning conference with the health educator, preparation of the topic, presentation followed by questions, and travel to a rural church. It was decided that, whenever possible, requests for such participation would be made by a community person who had a personal relationship with the provider.

A health education graduate assistant provided technical support to the practitioners in planning and designing their presentations, the intention being to assist in the preparation of material appropriate to the learning style of the audience. Suggestions for content and questions from participants were given to the presenters in advance with the intention of increasing volunteer interest in the session and providing professional insight into the level of knowledge and types of concerns likely to be expressed during the sessions. We hoped that close attention to the need for information, and an informal format in a setting comfortable to the volunteers, would facilitate communication.

Physicians participating in the project were Dr. Joseph Dugan, an internist in private practice in Siler City, who developed the module on diabetes; Dr. James Swankl, who anchored the series on maternal and child health; and Dr. Samuel Putnam, an internist employed by the Orange-Chatham Comprehensive Health Center in Moncure, who provided oversight for the module on hypertension. A nutritionist and nurse from the health department, a clinical psychologist-epidemiologist from the University of North Carolina School of Public Health, and students from the Schools of Medicine, Nursing, and Public Health at the University of North Carolina at Chapel Hill presented or played support roles in the training program.

The importance of communication between community people and health professionals was emphasized in all sessions. Both the church volunteers and the professionals learned from these sessions. The professionals became aware of strengths in the community not previously recognized — strengths such as the role of the church in defining world view and providing affective and instrumental support during times of crisis, and the social power of church mothers*

*Church mothers are selected from the ranks of women, usually past 70 years of age, on the basis of wisdom, exemplary personal behavior and adherence to the spiritual life.

in matters related to child rearing, family life and issues concerning values and morality. The volunteers increased their knowledge about the resources and action necessary to improve maternal and child health and learned of ways to reduce the risk of developing hypertension and diabetes. They learned about resources at the individual, family and broader community levels that could be mobilized for better prevention, control, and management of these two chronic diseases found at high rates in their community. Feelings of social distance declined as the volunteers and the professionals discovered common ground.

Morale boosters I recall included over-enrollment in Dr. Dugan's series on diabetes; the public health nurse who stayed on for tea and cookies; requests for an additional session on stress management; and attending homecoming festivals and finding specially prepared foods for hypertensives and diabetics.

Evaluation was an important part of the demonstration project. Increases in the appropriate technical knowledge, particularly with regard to hypertension, diabetes and child/maternal health issues, have been measured, with positive results. Persons with less than 12 years of formal education experienced greater gains in pre/post test evaluations than those with high school educations. This suggests that those with lesser levels of education have less technical knowledge from the onset of the intervention. Although all participants learned, these participants learned more.

Diffusion of knowledge took place across church, community and racial boundaries. Ten percent of those receiving counseling from volunteers were white. Information was more likely to be transferred in the workplace and at the laundromat. Men tended to be less well-informed and less aware of health issues than women. Those selected by their congregations for health advocates training tended to be stable, somewhat better educated and economically better off than the average for their communities.

Conclusions

This project was a practical demonstration of outreach, and it supports the notion that intervention at the community level is a sound means of addressing problems of inadequate knowledge and resource utilization.

Beliefs, norms and values held at the community level often contribute to behavior patterns, influencing what people do to maintain health and treat disease. Strategies designed to share responsibility for the community's health must include ways to increase knowledge and health-positive action within the variety of subcultures that make up the service population.

The major challenge is to convince those in decision-making positions of the efficacy of outreach. This will require well planned and carefully evaluated interventions, with clearly identified benefits from allocating more resources to people at the grass roots so that they can play a stronger role in maintenance and improvement of their health. These benefits might include: (1) improved patterns of utilization; (2) greater reliance on personal and community resources for health management; (3) increased knowledge; (4) appropriate responses to new knowledge; (5) increased community support for health services; and (6) volunteer action groups targeting specific health and health-related concerns. ■

Are You Only Smiling For The Camera?

Or do you know someone who is?

Saint Albans Psychiatric Hospital in Radford, Virginia has been helping people deal with life since 1916. We offer comprehensive programs for adults and adolescents in chemical dependency, eating disorders, depression, out-of-control behavior and other life problems — all supervised by a skillful and compassionate staff.

When you know someone in need of psychiatric help, call Saint Albans.

We build real smiles.

The one you know best.

Let's get to the "heart" of the matter.
You want a "No Risk" System for your practice, and Med-Care has it!

Med-Care is the powerful office management system created for medical practices and clinics. Med-Care will improve the efficiency and productivity of managing and processing patient information while *improving cash flow*. In short, it will help you manage virtually every aspect of your practice.

The Med-Care System automates labor intensive functions like insurance processing, accounts receivable, billing, appointment scheduling and even routine correspondence. Med-Care has alternate fee schedules to help speed up your patient processing. HMOs and other PHP plans are handled with ease. It is also an invaluable business analysis tool, providing the insight you need to make well-informed decisions about the performance and future growth of your practice.

But what you'll appreciate most about The Med-Care System is its simplicity. A basic knowledge of bookkeeping, billing, and insurance claim procedures is all the experience you need.

A Complete Management System Designed in Cooperation with Medical Professionals.

The reason for The Med-Care System's superior performance and simple operation is that we designed it in cooperation with the medical industry, not just systems programmers, but physicians, medical accountants and medical office managers — people with the real knowledge and understanding of medical office management.

Unless you have an insight into computers and software, selecting the right system as well as the proper support and training can be a difficult, time-consuming and very expensive experience. To make things easier on you, The Med-Care System was developed as a complete system. Everything you need — software, hardware, training and support — is included.

The Med-Care System comes complete with the Medical Office Management Program, Texas Instruments Micro or Mini System Computer with multiple work stations, printers and high capacity disk drives. Each system is tailored to the specific needs of your practice. And as your practice grows, Med-Care is flexible enough to grow with you.

The Texas Instruments Computers are expandable and support up to 128 workstations with the ability to expand storage as it is needed. They were selected for their price-performance and reliability in group practice environments.

Every Aspect of Your Practice Will Run More Efficiently.

Med-Care software is so versatile, you can tailor it to every management function in your practice. And even if you've never used a computer before, automating your practice with The Med-Care System is simple.

Med-Care's one-time data entry function is another time-saving feature. Because it's totally interactive throughout, you never need to enter the same data more than once.

Here are some of the ways Med-Care can improve the way you manage your practice:

- Speeds up insurance processing by handling multiple claims per patient and can transmit paperless claims to Medicare and major carriers.
- Improves staff management by maintaining information for multiple doctors and locations.
- Reduces collection time by tracing unpaid insurance claims.
- Increases efficiency by aging accounts and insurance pending files automatically.

- Eliminates paperwork by generating daily charge tickets and appointments.
- Increases cash flow by printing statements, medical reminders and collection letters.
- Improves patient service by providing instant access to each patient's medical records.
- Reduces paperwork by generating daily, monthly, or yearly receipt and charge reports by doctor, by procedure and by practice.

Med-Care's Person-To-Person Training: A Nice Way To Get Started.

Before you invest in a medical office management system, it's important to know what you're getting for your money. With The Med-Care System, what you get is more than hardware and software. You get the personal care and attention that has become a trademark of the people at Med-Care.

The moment your system arrives, the people at Med-Care will be there to guarantee a smooth, trouble-free start-up. They'll take you through an informative five-day practice clinic to ensure that everyone feels comfortable and confident with the new system. It's a nice way to get started.

But that's only the beginning. The people at Med-Care help you throughout the year. Our qualified customer service staff is specially trained on the Med-Care System. If you ever have trouble, they'll respond immediately.

We'd like to show you how simple it is to put Med-Care to work for your practice.

In just 30 minutes the system can be demonstrated at no cost or obligation to you. You'll get to see firsthand how The Med-Care System has helped many practices like yours to improve cash flow, increase productivity, and most importantly, improve the overall management of their patients.

All of these things are why Med-Care is the "No Risk" medical practice system for you.

Carotid Cavernous Fistula

Closure with Detachable Silicone Rubber Balloons

John T. Curnes, M.D., Robert A. Whaley, M.D., and
Bradford B. Walters, M.D., Ph.D.

Traumatic carotid-cavernous fistulae are caused by injury to the cavernous portion of the internal carotid artery. The clinical syndrome accompanying this injury is unmistakable and dramatic. Treatment of the fistula using a detachable balloon system can be a safe and practical method of dealing with this problem.

Our patient was a 21-year-old white male who was assaulted in December 1986. He suffered a mandibular fracture and facial fractures. Shortly thereafter, he noted a "whushing" sound in his right ear, as well as double vision for the first time.

He had a markedly proptotic right eye with conjunctival injection. This eye pulsed and had an easily audible bruit. In addition he had a mild third nerve palsy on the right and venous engorgement on fundoscopic exam.

Cranial computed tomography (CT) of the head and orbits was performed with contrast infusion, demonstrating a bulging right cavernous sinus, proptosis, and enlarged superior orbital vein (figure 1). Confirmation of the diagnosis was made at cerebral angiography, where a large traumatic fistula was demonstrated between the right internal carotid artery and the inferior portion of the right cavernous sinus (figure 2).

The patient was taken to the angiographic suite where a 9F catheter was inserted into the right internal carotid artery via the transfemoral approach. A sterile mini-balloon was maneuvered into the area of the fistula, inflated to about 5-6 mm in size, and detached. A post procedure angiogram showed slowed but persistent flow in the fistula. A second balloon, of similar size, was directed through the fistula, inflated and detached. A second angiogram showed essentially complete obliteration of the fistula (figure 3). Auscultation failed to elicit a bruit, and examination of the eye showed immediate decrease in proptosis and chemosis. A lateral non-magnified view of the skull was taken

Figure 1. Cranial computed tomography with contrast infusion showing a dilated cavernous sinus (open arrows), and enlarged superior ophthalmic vein (large arrow). Note the normal size of the cavernous sinus and superior ophthalmic vein on the left.

Figure 2. Right internal carotid arteriogram demonstrating a large carotid cavernous fistula draining primarily into the superior ophthalmic vein anteriorly (open arrow) and the inferior petrosal veins posteriorly. Carotid artery (curved arrows), cavernous sinus (small arrows).

Figure 3. Right internal carotid arteriogram after placement of two 2 mm balloons in the cavernous sinus via the fistula. Note essentially complete obliteration of the fistula.

following the procedure and repeated the next morning to document the size and location of the balloons (figure 4).

Post-procedure course was notable for severe pain over the next 24 hours, controlled by morphine, and a sixth nerve palsy. He was discharged on the second post-procedure day. However, twelve days after the embolization, he returned with acute worsening of pain and increasing diplopia. Examination revealed complete third nerve palsy. A lateral skull film suggested that slight superior migration of the posterior balloon had occurred, possibly stretching the third nerve acutely. Repeat angiography showed no recurrence of fistula, and the carotid was widely patent. However, there was a 1x1 cm² pseudoaneurysm originating near the site of the previous fistula (figure 5). The patient's pain and diplopia improved markedly over the next several days.

Discussion

Carotid cavernous fistulae can be of traumatic, spontaneous, or congenital origins. By far, the traumatic causes are most common, usually resulting from a severe basilar skull fracture with tearing of the carotid artery. Other less common traumatic causes include stab wounds, injury during transphenoidal removal of pituitary lesions, or injury following Fogarty balloon removal of clot from the carotid artery at endarterectomy.¹

The most common presenting complaints by the patient include bruit, proptosis, conjunctival redness, diplopia, and blurred vision. All nerves traversing the cavernous sinus, namely the third, fourth, sixth, and first division of five, can be compromised as a result of either the initial trauma or the increased flow through the fistula. Rarely, hypoxic ocular changes may lead to blindness.

The computed tomographic and angiographic features of these fistulae are unmistakable. On CT, an enlarged cavernous sinus, prominent superior orbital vein, and proptosis confirm the clinical impression and mandate angiography.

Figure 5. Repeat right internal carotid arteriogram three weeks later, showing 1x1 cm² pseudoaneurysm (arrows).

Selective internal and external carotid angiography, with rapid filming, delineates the exact point of communication. In the vast majority of cases this is located where the internal carotid artery pierces the inferior portion of the cavernous sinus. This fistula results in very early, dense opacification of the cavernous sinus — so dense, in fact, the fistula cannot always be seen. By injecting the ipsilateral vertebral artery while compressing the carotid artery, one can obtain an exquisite view of the fistula via contrast refluxing through the posterior communicating artery, down the cavernous carotid, and out the rent. Other angiographic features of carotid cavernous fistulae include dilation of secondary venous structures (especially the superior ophthalmic vein) and poor visualization of the intracranial vasculature.

Many procedures have been employed in the treatment of this disorder, including direct surgical or intravascular occlusive therapy. The techniques of transfemoral intravascular embolization have now improved to the point that the detachable balloon has become the treatment of choice for carotid cavernous fistulae.

The Bard Parker mini-balloon detachable balloon system is the device with which we have had the most experience.² It comes in a unique pre-prepared delivery system that facilitates the rapid and accurate introduction of the balloon to the site of the fistula (figure 6). The silicone rubber balloon, attached to a radiopaque, 3 French, polyurethane catheter, is injected through a larger catheter already in place in the internal carotid. After the balloon is inflated with a radiopaque contrast agent, a small valve mechanism at the junction of the balloon and catheter permits the balloon to be detached from the catheter and remain sealed (figure 7). Subsequent blood stasis, clotting and fibrous tissue growth at the balloon site produce permanent occlusion and guard against balloon migration. The balloon remains in the vessel and is easily visualized on skull radiography (figure 4).

Complications can be expected in about a third of patients in whom this procedure is performed.^{3,4} The most common adverse effect is that of transient cranial nerve palsy. This

is usually due to compression of the nerves against the wall of the cavernous sinus, and almost always resolves in days to weeks. Our patient had an almost immediate sixth nerve palsy, and several days after the procedure he developed a third nerve palsy, the latter probably related to movement of a balloon within the sinus. Pain can also be a prominent feature, due to tension on the dura and first division of the fifth cranial nerve. Pseudoaneurysm formation can also occur, causing pain and third nerve palsy. In those patients in whom the pseudoaneurysm is small (less than 1 cm) as in our patient, the pseudoaneurysms do not go on to enlarge or become a problem clinically. However, in those cases where the pseudoaneurysm is larger, and intractable pain and cranial nerve deficit predominate, it may be necessary to permanently occlude the carotid and the neck of the false aneurysm with another balloon.⁵

A more serious problem can occur when the balloon becomes detached in the mainstream of the carotid artery, not in the fistula. This can result in occlusion of the internal carotid artery, or intracranial migration and occlusion of the middle cerebral artery. Neurologic deficit can result, either temporary or permanent.

Balloon deflation can occur also, possibly resulting in distal embolization. Fortunately, fibrosis and obliteration of the fistula has usually occurred by a week to ten days, preventing migration of the balloon outside the cavernous sinus.

In summary, the treatment of choice for carotid cavernous

Figure 6. Photograph of the balloon system displaying the inflated balloon (open arrow), 3 French catheter (straight arrows) introducing system (curved arrows) and syringe used to inflate the balloon (at left).

Figure 7. Schematic of balloon and valve pin. (A) The partially inflated balloon fills with contrast. (B) Once the balloon is compressed by the sidewalls of the cavernous sinus, fluid or contrast material leaks through the sidehole of the valve pin, thus lubricating the contact points of the balloon neck and valve pin permitting easy detachment. (C) Catheter and valve pin withdrawn from inflated balloon.

fistulae is with a detachable balloon placed in the fistula via an endovascular, transfemoral approach. In the hands of experienced neuroradiologists, the probability of successful obliteration is high and the complications of the procedure can be minimized. ■

PHYSICIANS, SCHEDULE SOME TIME FOR YOUR COUNTRY.

Many physicians would like to devote some time to their country in a local Army Reserve unit. We know that making a weekend commitment can be difficult for most physicians. So it is practical for the Army Reserve units to be flexible about time. It's worth discussing.

Incidentally, in addition to satisfying your own desire to serve your country, there are exceptional opportunities to do something totally different from a day-to-day routine. Opportunities to study new areas of medicine, meet new people in your specialty, and be a part of one of the world's most advanced medical teams.

Discuss the opportunities with our Army Medical Personnel Counselor.

FOR SURGEONS LOOKING FOR A CHALLENGE.

Your challenge could be the Army Reserve unit near you. It's a unit that requires the services of surgeons.

You may wish to explore the challenge of teaching in a major medical center. You may wish to explore the special challenges of your specialty in triage. Certainly you'll be confronted by challenges very different from your daily routine.

You'll also have an opportunity to participate in a number of programs in which you'll be able to exchange views and information with other surgeons from all over the country.

The Army Reserve understands the time demands on a busy physician, so you can count on us to be totally flexible in making time for you to share your specialty with your country. We'll arrange your training program to work with your practice.

To find out about the benefits of serving with a nearby Army Reserve unit, we recommend you call our Army Medical Personnel Counselor.

PHYSICIANS, THERE ARE TWO KINDS OF FLEXIBILITY IN THE ARMY RESERVE WE THINK YOU'LL LIKE.

One, time. We know how tough it is for a busy physician to make weekend time commitments. So we offer flexible training programs that allow a physician to share some time with his or her country. We arrange a schedule to suit your requirements.

Two, the opportunity to explore other phases of medicine, to add a different kind of knowledge—the challenge of military health care. It's a flexibility which could prove to be both stimulating and rewarding, with the opportunity to participate in a variety of programs that can put you in contact with medical leaders from all over the country.

See how flexible we can be, call our Army Medical Personnel Counselor.

**ARMY RESERVE.
BE ALL YOU CAN BE.**

HERE'S ONE DOCTOR WHO WON'T PAY HIS MALPRACTICE PREMIUMS THIS YEAR.

The Army covers his premiums. Since he's an Army Physician, there are a lot of worries associated with private practice that he won't have to contend with. Like excessive paperwork, and the overhead costs incurred in running a private practice.

What he will get is a highly challenging, highly rewarding experience. The Army offers varied assignments, chances to specialize, or further your education, and to work with a team of dedicated health care professionals. Plus a generous benefits package.

If you're interested in practicing high quality health care with a minimum of administrative burdens, examine Army medicine. Talk to your local Army Medical Department Counselor for more information.

"When I Grow Up..."

Playing "grown-up". One of the joys of childhood. Dressing in "grown-up" clothes, walking in "grown-up" shoes, and mocking "grown-up" words.

But everyday, children are stricken with the most dreaded of all "grown-up" diseases—cancer. And their games are ended.

To too many of these children, playing "grown-up" will never be anymore than that—playing. Many of these

children won't even play "grown-up" again.

At St. Jude Children's Research Hospital, we're fighting to put an end to this senseless loss, and we're working toward a day when no innocent "grown-up" will lose her life to cancer.

To find out how you can help in this desperate struggle, write to St. Jude, 505 North Parkway, Memphis, TN 38105, or call 1-800-238-9100.

**ST. JUDE CHILDREN'S
RESEARCH HOSPITAL**

Toys

Good, Bad, but Never Indifferent

SHIRLEY K. OSTERHOUT, M.D.

According to Webster's Dictionary, a toy is a pastime or a sport, a plaything, trinket or bauble, a thing of little value or little importance.

It is probably a rare parent who would consider a toy that is used and loved by a child to be of little importance, much less of little value. Toys are used to stimulate creativity, to provide endless hours of happiness, to encourage social interaction, to improve physical coordination, and to teach new tasks. They are also a source of heartbreak when broken or lost, of arguments between siblings, and of envy. The toys advertised in the supplements that thicken our newspapers starting in November give a wonderful history of the culture of the time, popular fads, favorite movies and television programs, and our national mood, whether peaceful or violent. But toys can be dangerous and can kill.

We do not like to read in newspapers that the United States Consumer Product Safety Commission estimates more than 135,000 persons received hospital emergency room treatment from such favorite playthings as dolls,

toy trucks and cars, toy wagons, and balls. We do not want to read in the medical literature that cytomegalovirus can be recovered from toys recently mouthed by infected children.

Falls on or against toys are frequent causes of accidents resulting in cuts and bruises, fractures, and strangulation.

Children have also seriously injured themselves by swallowing or choking on small parts, by placing tiny toys or parts in noses or ears, and by cutting themselves on sharp objects and points. There are toys that are hazardous because of chemical ingestion or skin burns, and electric shock and burn injuries.

Although our dictionary definition calls toys baubles and trinkets, there are playthings that do not come under

this description but that do fit into the consumer definition, such as roller skates, ice skates, skateboards, tricycles, bicycles, all-terrain vehicles (ATVs) and airguns.

Toys, in the broader definition, are an integral part of our life, health, and safety. Each year, 5,000 new toys enter the marketplace. The Christmas holiday season will find an estimated 150,000 different kinds of toys for sale at over a million retail outlets.

Medical Director, Duke Poison Control Center, Duke University Medical Center, Durham. Artist: Irene Roderich.

Hazards

What are the hazards? Why do we allow them? Should we put the blame on the manufacturer, the government, or the consumer? All three.

Under the Federal Hazardous Substance Act and the Consumer Product Safety Act, the United States Consumer Product Safety Commission (CPSC) was established in 1973 and has set safety regulations for certain toys and other children's articles such as sleepwear. Manufacturers must design and make their products to meet regulations so hazardous products are not sold.

Some regulations set safety specifications for specific kinds of products, while others deal with hazards from a wide variety of toys or children's products. The following CPSC toy regulations are now in effect.

Sharp points and sharp edges. Regulations that became effective in late 1978 and mid-1979 provide manufacturers with testing methods to ensure that toys and other articles intended to be used by children less than eight years old do not have hazardous sharp points or hazardous sharp glass and metal edges.

Small parts. In 1980, regulations were developed eliminating small parts from toys intended for use by children under three years of age. Unfortunately, under this current standard toys on which small children can choke are labeled as safe for children's use.

The Consumer Federation of America in a recent newsletter criticized this regulation, which, although it states that all products for youngsters less than three years must not present a hazard of choking aspiration or ingestion, does not provide test techniques adequate to prevent injury and even death. The government uses a small parts test cylinder with a diameter of 1.25 inches and a depth of 1 to 2.25 inches. If an object fits within the test cylinder, its sale is prohibited. If any part protrudes from the cylinder, the object passes and may be sold as safe. Thus, a toy passes the standard regardless of diameter if long enough to protrude from the cylinder. According to a report by the CPSC in 1983, at least 49 of 136 choking incidents, including at least 36 deaths, involved objects passing this standard.

Pacifiers and rattles. Even an infant may not be safe. Regulations require that these objects be designed so that they cannot lodge in an infant's throat or separate into small pieces.

Clacker balls. These are a novelty toy consisting of two plastic balls, connected by a cord, which can be "clacked" together by a rhythmic motion of the hand. These toys must be made in accordance with strict performance requirements so that the plastic balls will not shatter or fly off the ends of the cord.

Electrically operated toys. Since 1973, safety specifications have been in effect to prevent electric shock and burn injuries resulting from poorly made electrical toys.

Lead paint. The amount of lead in paint used on toys and other children's articles is severely limited to less than 0.06%.

Sound level of toy caps and guns. The Commission regulates the amount of noise made by these products to prevent hearing damage.

Lawn darts. These must not be sold in toy stores and must be labeled to indicate that they are not toys and could cause serious injury if misused.

Toys with hazardous chemicals. The Federal Hazardous Substance Act prohibits the use of poisonous and otherwise harmful chemicals in toys and other articles intended for use by children. Chemistry sets, model rocketry sets, model airplanes, fuel, craft sets and other products, which by their very nature must have such chemicals, may be sold if accompanied by instructions and warning labels.

There are also safety regulations for cribs, baby bouncers, walkers, bicycles, fireworks, and children's sleepwear. The Federal Bureau of Standards for many years before the Federal Hazardous Substance Act has regulated the content of crayons made in this country.

Manufacturers must show that their products comply with the regulations for toy safety. Investigators for CPSC inspect firms making or importing products to ensure that regulations are followed. The samples collected during inspections are examined at CPSC Laboratories. Products in violation can present substantial hazard and may be subject to recall. Retailers must then post signs in their stores advising consumers to return the product for a refund.

Despite the efforts of toy makers, retailers, CPSC inspectors, consumer deputies, and other federal, state and local government agencies, it is not possible to examine every toy. It is also not possible to regulate the making of certain toys, the selling of certain toys, the purchase of certain toys and the personal use of toys.

In 1986, CPSC recalled over 1.6 million crib toys because of alleged strangulation hazards to infants. These were colorful, stuffed triplet dolls that were strung together to go across the sides of a crib. They were available by mail order from a reputable toy distributor which advertised in nationally known magazines read widely by parents of young children. About 65,000 were sold through retail stores. There had been two complaints, from the parents of a 10-month-old and a seven-month-old who had allegedly strangled when they became entangled in their cribs. Unfortunately only about 10% of consumers take advantage of the opportunity to return such recalled items.

There have been other similar toys — crib gyms, exercisers, kickers — which are attractive additions to a child's environment, but which are dangerous. The risk of strangulation from these toys is well established. The risk begins when infants are beginning to push up on hands and knees, usually about five months of age. These

babies can pull themselves up to a hanging crib toy and become entangled or fall forward over it. Because infants cannot disentangle themselves, support their own weight, or lift themselves from the toy, this kind of accident can result in serious injury or death. These toys should never be used in cribs and playpens.

There are no standards or tests regulating such toys except common sense and knowledge. There are appropriate places for them in which they can be used with supervision. However, meaningful regulation is not possible because the hazards stem from use rather than design, and in any case these toys can be made by parents, with some magazines even giving directions.

This brings us to a large group of unregulated toys — those made by hand by family members or by crafts people. The latter are usually sold at bazaars, fairs, flea markets and craft shops. Homemade toys are quite popular today. They are most notorious for being dangerous because they may contain small parts which are readily detachable.

Although CPSC makes efforts to control imports, it is not uncommon for foreign-made toys to make the news media and consequently for parents to panic. Several years ago, an imported stuffed animal caused several instances of trauma from an internal wire which became loose and protruded sharply from the animal. In

late 1986, a recall was issued for robot toys distributed by a well-known domestic toy dealer, but made in Taiwan and Japan. The paint used in the Taiwan-made product was higher in lead than allowable by law. Approximately 866,000 sets and pieces made in Taiwan were sold nationwide beginning in July 1985. Those made in Japan were considered safe. In the age range for which these toys would be most appropriate, lead poisoning would not be expected since it would not be absorbed through the skin. However, younger siblings might find it fun to chew on these toys!

Another problematic category is toys purchased in for-

eign lands as gifts or by families living abroad, such as service families, and brought back to the United States.

A popular weekend sport is exploring yard sales and flea markets, which are great sources of old and perhaps broken toys. Other unsafe children's articles are also found in these kinds of sales, such as old and perhaps broken cribs, play pens, car seats, jumpers, walkers, and carriages. These are frequently purchased by unwary consumers looking for bargains. At such sales it is not unusual to find products that were subject to recall or that are out of production due to unsafe features.

These problems also exist with "hand-me-downs" and antique toys, which should be carefully inspected before use.

"These toys should never be used in cribs and playpens."

Adults may also be victims of toy hazards. We all laugh at the movie or TV comedies when someone slips on ill-placed skates or toy trucks. In real life, these can be tragedies.

A three-year-old child seen in a local emergency room had a small plastic car, that had been used as a cake decoration, removed from his nose. There was no problem and he left the emergency room. Several hours later, his father was seen in the same emergency room for the same complaint with the same car! He had not been at home when his son had had the accident, and he doubted that the car could pos-

sibly be placed so that it could not be removed. He learned his lesson rather expensively.

The trinkets used as party favors and cake decorations are not regulated, as they are not considered toys for children; but they are commonly used at children's parties and on children's cakes, so they do get into inappropriate hands and then into mouths and other orifices.

Advice for Consumers

The Duke Poison Control Center keeps as much information about toys as can be collected in order to respond

to the variety of calls about possible poisoning hazards. The Center receives many calls, regardless of season; however, we do find some seasonal trends.

During the summer, children are avid bubble blowers, and some end up ingesting the commercial solutions. Often, homemade solutions are prepared from various liquid detergents. Either kind results in mild vomiting.

At the beginning of the Christmas season, the media want stories about holiday hazards, mostly about plants and decorations; but toys and associated articles get more popular at poison control centers each year.

Chemistry sets lead the list. The toxicity obviously depends on the chemical involved, the concentration and the route of contact. In the spring of 1987, we managed a young girl with mild skin burns from sodium silicate. Small disc batteries would be second on the holiday toy list. These rarely cause toxic problems, but if swallowed may result in perforation and local mucosa burns of the gastrointestinal tract. And of course, what about the grandmother who wanted to know if the doll that stoolled following feedings of the included "special baby food" would cause a bacterial illness if the "food" stayed too long in the doll? Was it a safe Christmas gift? After giving her my own personal opinion, I gave her the toll-free number for Consumer Products Safety Commission's advice on toys: 1-800/638-CPSC.

Children's perfume is usually considered innocuous, yet we have had the opportunity to deal with one brand containing methanol.

Although chemicals in children's toys are regulated, no one regulates homemade copying. A number of years ago, a popular doll had a home permanent set with small bottles of chemicals. What happened when they were used? Instructions were included so that more could be made. This was brought to our attention when a child was thought to have lip burns from drinking the ammonia solution mom had prepared in a pint container far larger than the tiny bottle which was in the original set. Fortunately, the lesion was early chicken pox and not a corrosive burn.

While regulated for hearing damage, what happens when a roll of caps is swallowed, or shot in an enclosed area where mom cannot hear, resulting in potential toxic fumes?

There are always ingestions or eye contaminations from various craft-making chemicals. What would poison centers do without the routine calls on Play-Doh, Etch-a-Sketch, water colors, finger paints, magic markers and crayons (which are all non-toxic except certain imported crayons)? What would we do without ingestions of Baby-Magic Milk Bottle, and liquid from teething rings, floating toys, and snow scene globes, again all non-toxic. Salmonella may contaminate the latter if they are imported. Of course there are always calls about allergic or carcinogenic effects of contact with dyes or other chemicals used in toy productions. Our major concern with "toy" ingestion is choking. It is amazing what young children

will bite off.

The storage of toys may also be of importance. A number of years ago, certain toy boxes were recalled because the lids were heavy and did not remain open, therefore falling quite unexpectedly on the child. Storage of toys is important, as the following personal experience demonstrates. A black widow spider made her home in the cab of a toy truck, many years ago in my driveway. It took her a brief time to accomplish this task. Fortunately, she was discovered before the truck's young owner started building his road again, but she could have created a severe problem for an unsuspecting child. So it is important to watch where toys are stored or left even for short periods of time.

In 1986, an alert in the media brought to attention that some commercially distributed play sand in New Jersey was contaminated with asbestos. A mineral, tremolite, which exists as asbestos or non-asbestos, was found in its non-asbestos form during testing of the sand. Several inquiries were placed to the Duke Poison Control Center. Testing has been done in North Carolina with negative results.

Before toys are removed from the home and our children are needlessly overprotected, there are guidelines which are important for consumers to consider.

Guidelines for the Purchase and Use of Toys

- 1 New and old toys around the house should be checked periodically for possible hazards.
- 2 Children should be taught to put their toys safely away on shelves or in a toy chest after playing to prevent tripping on them and falling.
- 3 Toy chests should be checked for safety. Use a toy box that has a light-weight lid that can be opened easily from within. The lid should stay open when raised. For extra safety, be sure there are ventilation holes for fresh air. Watch for sharp edges that could cut and hinges that could pinch or squeeze.
- 4 Toys should suit the skill, abilities and interest of the individual child. Do not purchase toys that are too complex for young children. Too many parents assume that their bright child is far enough advanced intellectually to handle a toy designed for older children. This is an unsafe assumption. Toys should also be bought with the child's maturity and level of responsibility considered. A youngster who is not going to take proper care of a complex and possibly dangerous toy could be responsible for a severe accident to a younger sibling. Remember, a toy that is safe for an eight-year-old may be hazardous for a younger child.
- 5 Avoid hand-me-down toys with small parts for children under three years of age.

- 6 Look for labels giving age recommendations, such as "recommended for children three to five years old." Use good judgment in deciding whether a toy may be hazardous for a particular child.
- 7 Avoid toys that shoot objects, injuring eyes.
- 8 Arrows and darts used by children should have blunt tips made with resilient material, such as rubber or plastic suction cups. Make certain these tips are secure.
- 9 For infants and very young children, avoid toys with long strings or cords. Cords may become wrapped around an infant's neck causing strangulation. Never hang toys with long strings, cords, loops or ribbons

in play pens or cribs where children can become entangled.

- 10 Explain to a child how to use toys properly and safely.
- 11 See that toys used outdoors are stored after play. Rain or dew can rust or damage a variety of toys and toy parts, which could create hazards.
- 12 Examine toys periodically, watch out particularly for sharp edges and points that may have developed. Repair broken toys and discard toys that cannot be fixed.

Think toy safety, and remember — there is no substitute for adult supervision and common sense. ■

A defense against cancer can be cooked up in your kitchen.

There is evidence that diet and cancer are related. Follow these modifications in your daily diet to reduce chances of getting cancer:

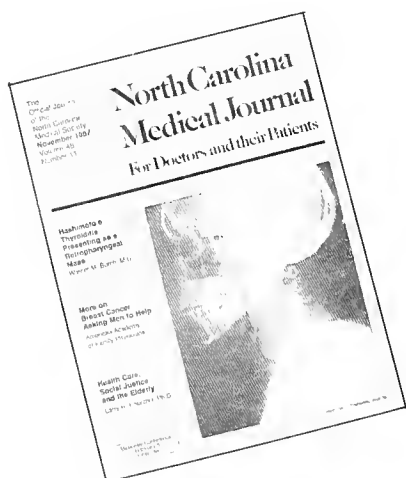

1. Eat more high-fiber foods such as fruits and vegetables and whole-grain cereals.
2. Include dark green and deep yellow fruits and vegetables rich in vitamins A and C.
3. Include cabbage, broccoli, brussels sprouts, kohlrabi and cauliflower.
4. Be moderate in consumption of salt-cured, smoked, and nitrite-cured foods.
5. Cut down on total fat intake from animal sources and fats and oils.
6. Avoid obesity.
7. Be moderate in consumption of alcoholic beverages.

No one faces
cancer alone.

Give yourself a hand against breast cancer

Breast self-examination is easy, takes only a few minutes and can be performed in the privacy of your own home. It's an important way you can detect early and highly curable breast cancer. Through monthly breast self-examinations, you will learn how your normal breast tissue feels and will be able to recognize a change if one occurs. In fact, most breast lumps are found by women themselves.

Take control of your body and your life.

Make breast self-examination a part of your monthly routine. And see your doctor regularly for clinical exams and advice on mammography.

For a free pamphlet about breast self-examination, call your local American Cancer Society.

We're here to help.

Our warehouses here at the Government Printing Office contain more than 16,000 different Government publications. Now we've put together a catalog of nearly 1,000 of the most popular books in our inventory. Books like *Infant Care*, *National Park Guide and Map*, *The Space Shuttle at Work*, *Federal Benefits for Veterans and Dependents*, *Merchandising Your Job*

Talents, and *The Back-Yard Mechanic*. Books on subjects ranging from agriculture, business, children, and diet to science, space exploration, transportation, and vacations. Find out what the Government's books are all about. For your **free copy** of our new bestseller catalog, write—

The Antivivisection Movement

A Threat to Medical Research and Future Progress

David C. Sabiston, Jr., M.D.

The antivivisection movement has again gained momentum and, together with a well financed network across the nation, it is vigorously supporting enactment of crippling legislation at the national and state levels. Such bills have been introduced and are pending action in the House of Representatives and the U.S. Senate in Washington as well as a number of state legislatures. In an effort to stem the tide, extremely thoughtful editorials in the *Washington Post*, the *Wall Street Journal*, and many other national papers and periodicals have presented compelling evidence opposing this effort.^{1,2}

The noted Michael E. DeBakey, pioneer surgeon and Chancellor of Baylor College of Medicine, summarized the current drive of the antivivisectionists and the corresponding challenge to the scientific community, stating: "If scientists abandon cat and dog experiments for other models that are not as suitable or as well understood, many potential medical breakthroughs may be severely crippled or halted." He directed his remarks primarily at the Mrazek bill currently before the House of Representatives and the Senate in the nation's capitol. This legislation would ban the use of pound animals for any research supported by the National Institutes of Health, which is the primary source of biomedical research funding throughout the nation. The tragedy of this bill is that not only would it cripple research and retard future progress but these abandoned animals would nevertheless be killed in the pounds. This is an especially grave issue since each animal bred specifically for research costs much more than does a pound animal, a factor which is compounded many times when one considers that the total amount of funding for research has been diminishing in recent years. Were this, or a similar, bill to pass in Congress or in state legislatures, there would clearly be far less research, and a concomitant reduction in new and original contributions to medicine.

Antivivisection has a long background, and from time to time animal rights groups resurface with considerable force and influence, as is currently the situation. Vigorous demonstrations favoring antivivisection have been made at the nation's treasured center of research, the National Institutes

of Health in Bethesda, Maryland. Moreover, zealous groups have secretly invaded a number of research laboratories, destroying laboratory equipment and important scientific data.

The Movement in History

In its strictest definition, the word *vivisection* means "cutting or operating on a living animal." However, in the late 1800s, it acquired a broader meaning and was used to refer to animal experimentation in general. Heavily organized movements began in the 1860s and 1870s in the British Isles, and in 1875 the Victoria Street Society was formed by Frances Power Cobbe, a journalist who wrote about feminist, religious, and philanthropic issues.

The Victoria Street Society became the hub of antivivisection activity, and Cobbe succeeded in convincing Lord Shaftsbury, the eminent and powerful reformer of the day, to become the first president of the society. He was obviously chosen for his social prestige as well as his political power. Later that year, the Royal Commission was formed and charged to "establish the extent of experimentation on living animals taking place in Great Britain, the amount of cruelty that might be taking place in connection with the experimentation, and the best means of preventing such cruelty." The Royal Commission recommended a bill that became known as the Cruelty to Animals Act of 1876, which required that any person performing experiments on living vertebrate animals be licensed, and that this license be renewed annually. The laboratories of these investigators were periodically checked without notice, and *each* experiment had to be individually approved by the Home Office in London prior to being performed. Moreover, the investigator was required to adhere strictly to the protocol, irrespective of the finding of interesting and unexpected results, which, as all investigators recognize, frequently changes the course of true research.

Lord Lister, the father of antiseptics, wrote to the noted Philadelphia surgeon W.W. Keen: "Our law on antivivisection of 1876 should *never* have been passed, and ought now to be repealed." Lister underscored the important role

James B. Duke Professor of Surgery and Chairman, Department of Surgery, Duke University Medical Center, Durham 27710.

animal experimentation played in his own research, which led to major contributions in antisepsis and in making surgery safe for the patient. In writing to the *British Medical Journal* in 1897, Lister said: "There are people who do not object to eating a mutton chop, people who do not even object to shooting a pheasant with the considerable chance that it may be only wounded and may have to die after lingering in pain, unable to obtain its proper nutriment, and yet who consider it something monstrous to introduce under the skin of a guinea pig a little inoculation of some microbe to ascertain its action. These seem to me to be most inconsistent views."

The Continuing Need for Animal Research

Physicians, civic leaders, representatives in federal and state government, and the public at large should be familiar with the fact that the vast majority of medical advances of the 20th century have been dependent upon animal research. The major health problems being faced today are no different, and will predictably require the same type of investigation in the experimental animal prior to application in humans. The spectre of poliomyelitis, formerly a dreaded disease, has all but disappeared in the past three decades following the development of the Salk and Sabin vaccines. Both of these vaccines were first administered to monkeys to test their safety as well as efficacy prior to their use in prevention of human poliomyelitis. Moreover, this need for animal use in testing polio vaccine continues today, as is emphasized by Dr. Joseph Bellanti, Director of Georgetown University's Immunology Center: every new batch of vaccines for polio, and for other childhood diseases, must be tested on animals to make certain that the virus has been adequately inactivated, and that it will indeed not transmit active disease to those children who are inoculated. Should the latter occur, it would obviously be a disaster. For every new vaccine produced, live-animal testing provides the answers to a number of vexing problems before the vaccine is used in humans.

Recently, a new genetic-engineered vaccine against hepatitis B has been developed in ovarian cells of the Chinese hamster. This vaccine promises to save the lives of over 2,000,000 humans annually, primarily in third world countries, since the present *human based* vaccine is very expensive, whereas the new one will be only a fraction of that cost and can be widely administered in these deprived nations. Is it conceivable that an intelligent, informed, conscientious public could believe it ethical to give a human such vaccines without previous testing in animals to assure safety?

Much publicity has been given the subject of Alzheimer's disease, and currently much research is being directed toward a better understanding of this disorder as well as means of prevention and treatment. Khachaturian, of the National

Institute of Aging, says, "Eight years ago we were at ground zero in understanding Alzheimer's disease. There has been incredible progress in research in this area because our investment in basic research concerns brain functions going back to the 1930s. The bulk of that research involved animals and they hold the key to continued progress." Through studies on primates and other animals, investigators have identified the region of the brain, the nucleus basalis of Meynert, which is the site involved in Alzheimer's disease.

Another major affliction and one with a tragic mortality, the acquired immunodeficiency syndrome (AIDS), is increasing in incidence annually. Currently, encouraging studies are being performed in monkeys and chimpanzees, which provide promising signs for an effective vaccine to be developed against this spreading epidemic. Quite clearly, a vaccine is necessary despite the promising pharmacologic agents currently being evaluated in the *treatment* of this deadly disorder. The first of these drugs, azidothymidine (AZT), has recently been shown to increase the survival of patients with AIDS at the end of the first year of treatment to 50%, as contrasted with randomized control patients receiving placebo who have only a 10% survival rate.

The more than 50 dietary essentials including vitamins and minerals now recognized as necessary to maintain life were determined largely by work on experimental animals. Another major achievement now used throughout the nation lies in the field of dentistry, where fluoridation is a notable example of the application of results of interrelated studies on animals and humans to public improvement. Many research reports have emphasized that fluoridation offers the easiest and most effective method of preventing dental cavities. The adding of fluoride to drinking water is both safe and effective, and strengthens the teeth against the decay-producing effects of acids in the mouth, thus reducing dental cavities by 60% to 70%. Once again, these studies were first done in experimental animals.

The public is also aware of the many achievements in heart surgery, which have been the direct result of the development of the heart-lung machine. Today, nearly all heart conditions requiring surgery can be successfully treated in often dramatic and near miraculous procedures. It should always be remembered that Dr. John H. Gibbon and his wife, Maly Gibbon, spent 22 years working as a close research team on many hundreds of animals to develop this machine before it was safe for human use. Further, every diabetic should realize that the discovery of insulin in the islet cells of the pancreas is another major medical achievement which had its origin solely in animal experimentation and replacement prior to the use of insulin in humans.

Animals also benefit from animal research. Louis Pasteur developed the vaccine against rabies through experiments on rabbits, and the livestock industry in the United States has benefited greatly from research now used to treat animal infectious diseases. In its editorial, the *Wall Street Journal* emphasized that, "After all, humans are not the only beneficiaries of laboratory research. Today millions of pets can

be free of heart disease, leukemia, or kidney failure solely as a result of experiments based on animal research. Some animal-rights activists can't seem to remember that." Indeed the chemotherapeutic agents and antibiotics, key agents in the treatment of a variety of infectious diseases, were first studied in experimental animals prior to their appropriate and safe use in humans.

The effect of the antivivisectionists and their ruthless approaches to investigators and research is best summarized by Dr. Frederick Goodwin of the National Institute of Mental Health, who says: "My people speak more and more of fear and demoralization concerning their research and the necessity to use animals for meaningful and objective experiments. If you stop funding or drive up costs by layers of regulation, nobody on the outside knows it's happening. Research just quietly dies."

The animal-rights groups in this country have become exceedingly strong and are attempting to eliminate all animal experimentation, which would clearly be a disaster for medical science as it exists today. The director of the Kennedy Center for Bioethics states: "We have to look at the consequences of giving animals rights — are you ready to say that we are more obligated not to use those dogs than we are to the thousands of human beings in this country who have heart attacks every year?" The American Heart Association recently issued a special report entitled "Position of the American Heart Association on Research Animal Use." In summary, the report stated: "Millions of Americans today are healthy, and other millions are alive, because of the advances in the prevention and treatment of heart disease. Death rates from the major forms of heart disease have declined steadily since about mid-century and the decline is continuing. Most recently, between 1972 and 1982, the death toll from cardiovascular disease declined 28%.

The decline is largely related to changes in life-style and development of methods of treatment, many of which are based upon animal experimentation."

To those who are educated and knowledgeable, it is apparent that there are many benefits from appropriate experiments on anesthetized animals since they would otherwise be sacrificed in public pounds. The facts are unmistakable and the reasons self-evident: such experiments are essential to medical progress. Civilization as we know it today, and indeed survival, may be at stake, given, for example, the necessity to control the AIDS crisis. According to the American Humane Society, 7,000,000 pet animals are abandoned to pounds or shelters each year, and of these 5,000,000 are killed there. These animals could be used productively and with professional care in research. The latter is very important and all investigators should be constantly aware of their obligations to conduct experiments with appropriate sensitivity for all animals.⁴

This issue is an exceedingly crucial one, and there is a compelling need for responsible citizens to join in supporting the principle of animal research in the prevention and treatment of disease for the betterment of all humankind.

You're The Experts In Medicine.

We're The Experts At Preventing Problems In Your Practice.

Medical Mutual is the physician-owned and physician-directed company committed to preventing problems in your practice *before* they occur. Through formal programs and day-to-day assistance, we help you identify areas of risk, reduce potential problems, and enhance your practice.

For example, our Medical Practice Survey brings specially trained staff to your office to audit the peripheral areas we've learned can create problems. The survey—which includes everything from documentation of patient drug

allergies to length of waiting time—offers practical suggestions for reducing your exposure.

Just as important, Medical Mutual provides ongoing assistance to respond promptly to your calls and questions. With 12 years of experience in professional liability coverage, we are the source of information for North Carolina. And if we don't have the answer, we'll find it for you.

Evolution of 911 in Pitt County

Our Story May Help Your County

Vanessa R. Reynolds, M.D., Fredrick L. Potts III, M.D., and William J. Jaffurs, Jr., M.D.

Single emergency telephone number systems give rapid, ready access to emergency services including law enforcement, fire fighting, and medical services. In Pitt County these services are well developed in many respects. The highest national standards are used for training, and life-saving equipment incorporates the latest technology. However, access to these systems remains a significant problem in Pitt County, as it does for many counties in North Carolina.

A 911 emergency telephone number has been a long time coming to Pitt County, and we are still at least two years away from implementation. Several problems have delayed development of this system that are likely shared by other communities in the state. We describe these problems, and in some cases offer solutions.

Background

In 1967 the President's Commission on Law Enforcement and Administration of Justice recommended, "wherever practical, a single (police emergency) number should be established, at least within a metropolitan area and preferably over the entire United States." This statement provided the official impetus for a nationwide emergency telephone number. Further support for this new concept was provided by the Commission on Civil Disorders and the Federal Communication Commission, which urged the telephone industry to provide a three-digit emergency telephone reporting number.^{1,2}

These recommendations and the growing public concern over the increase in crimes, accidents, and medical emergencies led to this January 1968 announcement by the American Telephone and Telegraph Company: The three digits 911 were available for installation on a national scale as the single emergency number. The choice of 911 was based

primarily on cost factors and on the comparative ease with which existing telephone systems could be modified to accept the numbers. It was thought that this number could be easily dialed and remembered by most persons.^{1,2}

The first 911 system was installed in 1968 by an independent telephone company in Haleyville, Alabama, a small community with a population of less than 4,000. Currently hundreds of systems are in operation throughout the country.^{1,2} Twelve county-wide 911 systems operate in North Carolina as of January 1985.³

A 911 system was first considered in Pitt County in 1979. The idea was initially unpopular.⁴ Modifications to the existing telephone system would be expensive, and the telephone company was unprepared to bear the cost. Also, at this time each township radio dispatched their own emergency personnel and vehicles. Perhaps fearing loss of autonomy, townships within the county would not agree to a centralized dispatch mechanism for emergency services.⁴ These problems would require careful study for solutions, and 911 entered a latent period in the county.

Elsewhere, in King County, Washington, a study was made of the communities' knowledge of numbers to call in an emergency, comparing three different emergency numbers: 911; a regional seven-digit number; and a local seven-digit number. One thousand one hundred ninety-two people were interviewed. Eighty-five percent of the population knew the correct number to call in 911 areas, versus 47% in regional seven-digit number areas. Only 36% knew the correct number in areas with a local seven-digit number.⁵ Currently in Pitt County local seven-digit emergency numbers are used. In a random telephone survey of residents of Pitt County, the authors found that of 139 persons contacted, 67 (48.2%) responded that they would dial the operator. Fifty-six (40.3%) either said they did not know the number or gave the wrong number, while only 16 (11.5%) knew the correct telephone number in their township for reporting emergencies. It is clear that communities like ours without a 911 system have poor awareness of emergency telephone numbers.

In addition to improving access, some 911 systems may

From the Department of Emergency Medicine, Pitt County Memorial Hospital, Greenville, and East Carolina University School of Medicine, Greenville 27858-4354.

reduce the time for emergency services to reach the caller. The metropolitan area of St. Paul, Minnesota was studied to evaluate whether 911 actually reduced the time between beginning the call for assistance and notification of an agency to dispatch appropriate services. The study examined this time interval before and after installation of an enhanced 911 system. Activation of an emergency service in less than one minute was achieved in 63% of the pre-911 calls and in 82% of post-911 calls, thus supporting 911 as a more efficient method of activating emergency services.⁶

A Revival of Interest

In 1984, the Pitt County Association of Rescue Squads revived public interest in 911 as a means of decreasing the response times for their lifesaving service. As a first step, the Pitt County Board of Commissioners approved the purchase of new 911-capable telecommunications equipment to be housed in the County Courthouse. The purchase of this equipment from Carolina Telephone and Telegraph Company was based on recommendations made by Telephone Consultants of Virginia, a private consulting firm. The equipment enabled the county offices to use the North Carolina State Telephone Network (STN). The normal 27.7 cents per minute cost to place direct dialing calls decreased to 12 cents per minute with STN.⁴ This is projected to save more than \$12,000 yearly on long distance and trunk line charges. Trunkline access is important because trunklines will be used exclusively for 911 when it is implemented. Dedicated trunk lines to each of the ten telephone exchanges in Pitt County should be rented from the telephone company to ensure rapid access and to avoid busy signals which are currently problems with the seven-digit emergency number systems. The trunk lines are estimated to cost \$18,000 a year to rent. The maintenance cost of a 911 system was beginning to look more bearable.

In February 1985, the Pitt County Board of commissioners met with mayors and town administrators to propose a county-wide 911 system and discuss establishment of a new centralized communication center at the County Courthouse. Although the concept of 911 was well received, several towns preferred to continue to do their own dispatching. The idea of 911 for individual towns instead of a county-wide system was discussed, but was determined to be infeasible because the telephone exchange boundaries and fire and rescue boundaries did not coincide. It was decided to postpone making recommendations for the system until further study of available options could be conducted.⁴

In 1985 The Pitt County Board of Commissioners appointed various town officials and citizens to a standing committee charged to study how to implement 911 in Pitt County. This 911 Emergency Number Study Committee (ENSC) most recently met in May 1987. They are currently facing several stumbling blocks to 911 implementation.

The first problem involves the use of existing telecom-

munications equipment by more than one agency. The County Communications Center, which houses the telecommunication equipment, is under the authority of the Sheriff's Department. This equipment currently provides access to the Police Information Network. This Network carries confidential information and is accessible only to law enforcement officers. Operation of a 911 center will require either integrating the two functions of the telecommunications equipment by using law enforcement personnel trained for dispatch, or establishing a second telecommunication center for 911 use. To accomplish the latter the telecommunications equipment must either be moved or new equipment purchased. The ENSC plans to poll counties with existing 911 systems to determine a feasible solution to this problem.

A second problem is that three townships in Pitt County prefer to continue to do their own dispatching rather than subscribe to centralized dispatch for the county. Multiple dispatch systems can only be accommodated by modification of the standard 911 system termed "call transfer," "call relay," or "call referral." These options are discussed in the next section.

Options

The type of 911 system that Pitt County will eventually have is still uncertain. There are four standard operational methods currently in use in the United States: direct dispatch, call transfer, call relay, and call referral.

Direct dispatch: 911 center answers the call, obtains the information and dispatches the appropriate resource to the emergency. This method has a fast response time, but requires cooperation for implementation.

Call transfer: 911 center answers the call, obtains enough information to determine the appropriate response agency, and transfers the call to that agency. The receiving agency takes the complete information from the caller and dispatches the emergency resources. There is minimal need for interagency cooperation with this method, but there is an increased response time, and it is more frustrating for the citizen to use since he or she must repeat the request several times.

Call relay: 911 answers the call, obtains the information, contacts the appropriate response agency, and relays the information to them. The response agency dispatches the emergency resource. This method has fast response time and preserves dispatch autonomy, but requires explicit call-answering protocols be established to gather necessary information from each caller.

Call referral: 911 answers the call, obtains the information to determine the response agency and provides the caller with the seven-digit number to call to reach the agency. This approach prevents 911 overload by non-emergency calls, but requires citizens to dial a second seven-digit number.⁷

Pitt County will most likely have a modified call referral

or call transfer system since some townships continue to do their own dispatching.⁸ Both of these options are inefficient and have minimal impact on reducing response times compared to the other options. Fortunately, both options preserve the most important advantage of a 911 system: improved access to emergency services.

Enhanced 911 is another important term in any discussion of emergency telephone number systems. Enhanced 911 provides selective routing of emergency calls, gives a visual display of the caller's phone number, the caller's address and the names of the local police, fire and ambulance agencies for that address.⁹ A comprehensive index of telephone numbers and street addresses is necessary for the operation of enhanced 911. Telecommunications equipment is connected to a computer which provides information based on the caller's telephone number. Enhanced 911 systems are considered state-of-the-art because they pinpoint the location of the caller and expedite the dispatch of services.

Problems

We observed the following problems in the process of developing a 911 System for Pitt County.

1. Initial cost. Each of 10 local exchanges requires two direct trunk lines monthly for 911 at an annual cost of approximately \$18,000. Installation costs another \$2,250.⁹ Some of this expense may be offset by savings incurred from the use of the State Telephone Network by County offices. Duplication of the existing telecommunications equipment, if necessary, is expected to cost \$200,000.

2. Maintenance costs. The tax base is such that some communities may not be able to afford the initial or maintenance costs. However, when this problem has arisen in other parts of the United States some communities have solved it by adding a fee to citizens' monthly telephone bills. Federal tax dollars to underwrite the cost of 911 telephone systems may soon be available through legislation such as Senate Bill 10, entitled "The Emergency Medical Services and Trauma Care Improvement Act of 1987."¹⁰

3. Information. County telecommunications equipment has an enhanced 911 capability, but currently there is no comprehensive index of telephone numbers and street addresses. Thirty-three percent of Pitt County residents are listed in the telephone directory by rural postal route or post office box. The exact location of the caller cannot be identified from the telephone number of origin. One can only estimate the general area from which the call is coming. Carolina Telephone estimates that at least five years are needed before we would be able to have this information for each telephone customer. The use of existing tax key

maps to help accomplish this task has been proposed.

4. Interagency Cooperation. This is required for dual use of existing telecommunications equipment. The complex issues of police confidentiality and efficient emergency service utilization have been dealt with effectively in other systems using trained dispatchers in a single communications center. The proposed "911 User Advisory Board," composed of representatives from government and public safety agencies, may facilitate interagency cooperation.

5. Fear of loss of autonomy. This problem exists in some townships and public agencies. For example, some towns maintain their own utilities. In case of power failure, residents call police who work with the power company to identify a cause and produce a remedy. The proposal for centralized dispatch sparks fear that towns and agencies may not be able to handle such problems as effectively as before.

Though numerous obstacles still exist to the development of an effective 911 system in Pitt County, progress is being made. When the system is implemented, Pitt County residents will have an improved method for reporting emergencies and summoning assistance. Eventually the 911 system may speed delivery and improve the utilization of our precious emergency service resources. ■

AIDS: Discrimination and Justice

John R. Dykers, Jr., M.D., F.A.A.F.P.

This article was reviewed by two experts in infectious diseases. They recommended that the Journal not accept the paper. I elected to publish the paper. Our readership has not used the Journal to discuss the implications to our social structure of the most serious disease that has occurred in our lifetime. I hope this paper — provocative as it is — will stimulate our doctors to tell us what they are thinking and how they intend to handle the medical, ethical, and social problems created by this epidemic. — The Editor

Our society has not yet arrived at a balanced and widely acceptable contract between those persons who are HIV-positive and those who are HIV-negative. The AMA House of Delegates struggled mightily with this dilemma and developed comprehensive recommendations,¹ a summary of which was published in the September issue of the *North Carolina Medical Journal* (1987;48:433-8). These recommendations provide leadership for sluggish bureaucracies and legislatures, but they fall short of probing the poignant areas of conflicting rights and of resolving the complex issues of discrimination and justice.

It is easy to understand the difficulty of deriving a balanced societal contract: AIDS is a terrible disease; we are helpless to treat successfully the disease or the virus; unjust discrimination arising from sexual taboos is prevalent, and our knowledge about virus transmission is incomplete.²

In order to propose a societal contract, one must first make some basic assumptions that are quite open to challenge:

A Fear of becoming HIV-positive is rational because knowledge about the transmission of the virus is primarily epidemiologic and derived from notoriously unreliable sexual histories. But such fear alone is not sufficient reason for quarantine or other irrational reactions that will worsen the consequences of our epidemic.

B Knowing one's negative HIV status and bearing the responsibility for maintaining that negative status is as important as knowing one's positive HIV status. Behavior that transmits the virus requires the interaction of both an HIV-negative and an HIV-positive person. Society has the right to expect HIV-negative persons to change their behavior on the basis of their own self-interest in maintaining their negative status rather than bear the horrible consequences.

C AIDS itself is so terrible that the negative social consequences of being HIV positive should be minimized as much as possible consistent with the health and safety of HIV-negative persons. Changes in behavior by HIV-positive persons are totally altruistic. Many HIV-positive persons will change their behavior based on strong altruistic motivations, but many will not.

D The confidentiality that the physician grants to the patient is non-judgmental and a highly practical matter necessary to allow the free flow of information required for a successful outcome of the physician-patient interaction, an outcome that is presumed to be better health, including the public health. Physician-to-patient confidentiality carries a legitimate price: the patient trusts the physician with information because he or she also trusts the physician's considered judgment of his or her broader societal responsibilities.

E Safe sex is a relative term,³ and there is no acceptable level of risk for sexual transmission of HIV, a virus that

presumably remains for a lifetime and is ultimately fatal. For maximum efficacy, rational counseling begins with knowledge of HIV status and includes both starting and stopping of risk-reduction practices.⁴ Any encounter is safer if it occurs between two people tested negative by current technology than the same encounter between two people of unknown HIV status. (See "analysis" below).

F The right not to know one's HIV status is a right we can no longer afford, but if we require that persons give up that right, we must grant reasonable and rational protection to those who are positive.

Accepting these assumptions, one may propose the following societal contract:

1 A federally financed program should provide health care for persons with AIDS, including counseling, acute hospital care, home health care and hospice care. The only criterion for qualifying for this program should be a positive HIV status.

2 Federal legislation, state legislation, local ordinance and judicial decision should forbid irrational discrimination in ordinary social settings, employment, housing, recreation and education.

3 Special work places dealing with blood and body fluids require special behavior and legislation. Patients and health care providers should, if asked, be required to tell one another their current HIV status, including the date that status was determined. Providing health care to HIV-positive persons and receiving health care from HIV-positive care givers should be done only knowingly and voluntarily. Then, and only then, does following the prescribed Centers for Disease Control guidelines for such care become appropriate.

Those persons engaged in prostitution, either as buyers or sellers, should be guilty of a felony if either solicits the other without the knowledge of the HIV status of both parties.

4 Voluntary testing for HIV status should be encouraged in every form. Private physicians should encourage potentially exposed patients to know their HIV status and to be retested should their exposure to sexual partners or blood products suggest the possibility that their status might have changed.

All persons considering conception should know their HIV status, and those testing positive should be required to take steps to prevent pregnancy or else forfeit their rights to publicly financed care. (One might well argue that it should be a misdemeanor to become pregnant without first determining one's HIV status or that it might be a felony to become or remain pregnant if one has a known positive HIV status.)^{5,6}

It should be the standard of care that anyone who has any sexually transmitted disease or uses IV drugs should be tested for HIV status. Sports, camp, and school physicals should require HIV tests for those who are sexually mature,

such maturity requiring physician judgment.

5 Mandatory test groups are not selected only by "high risk" behavior patterns, but by new intimacy. Mandatory testing should be required of all persons who are donating tissue, blood, semen, ova or organs; and of all persons seeking a marriage license, diagnosed pregnant, entering a hospital or prison, exiting a hospital or prison if this occurs greater than six months after entry, entering or leaving the military service, or participating in any drug rehabilitation program or sexually transmitted disease clinic.

International travelers should have an HIV test, the results of which should be recorded on the passport. Immigrants into this country are properly required to be HIV-negative at the time of entry and again six months later, and seroconversion within that six months should be grounds for deportation.

All persons mandatorily tested should be instructed about safe-sex and risk-reduction practices,³ including the possibility that persons tested HIV-negative may yet carry the virus. Whatever circumstances require mandatory testing of HIV status, a previously determined HIV status should be considered valid for no more than six months. Once tested positive, repeat testing should not be required.

6 All persons of known positive HIV status should be required to refrain from donating blood, semen, ova, tissue, or organs, and to inform any sexual partner or other person at risk of exposure to body fluids of that positive HIV status prior to sexual contact or other exposure. Failure to do so should be a felony. Then, and only then, do the recommended safe-sex and risk-reduction practices become ethically applicable. No one should knowingly have vaginal or anal intercourse with an HIV-positive person without first determining one's own HIV status and receiving professional counseling: failure to take such steps prior to such a sexual encounter should be a misdemeanor punishable by requiring mandatory HIV testing every six months for a minimum of two years. This is essentially unenforceable, but should be codified to define the societal expectation.

7 A spouse should have the right to require serotesting of the other spouse every six months. Refusal to be tested should be grounds for divorce, or alternatively a spouse should have the right to deny consortium to an untested spouse. Seroconversion that creates a discordant couple should be grounds for divorce. (Seroconversion that creates a concordant couple should not be grounds for divorce).

8 Determination of HIV status should be an accepted part of all applications for both health insurance and life insurance. There should be no requirement that either health or life insurance be sold to persons who are HIV-positive. This presupposes federal enactment of a comprehensive AIDS-care-financing program.

9 Falsifying documentation of HIV status should be a felony.

If we do not have the courage to act as though the prevalence of HIV were high, it will be. If we are going to survive the epidemic of HIV, those persons who test positive and those who test negative must respond to one another compassionately. We may not attain this goal, but we must strive for it.

It is to be hoped that our experimental models and precise knowledge about transmission, prevention and therapy will improve, fear will lessen and our contract will change. Meanwhile, following the contract outlined above, HIV-positive and HIV-negative persons can live without undue disruption or endangerment of one another. We must carry the presupposition that we are civilized sufficiently to care for those who are infected and to protect those who are not.

Analysis

A major difficulty arises in estimating the frequency with which persons tested HIV-negative by current technology will actually be carrying the virus and be capable of transmitting it. In August 1986 the rate of HIV-positives among Red Cross blood donors was 1.1 per 1,000.⁷ According to Dr. Steven Kleinman and Dr. John A. Ward at the Third International Conference on AIDS and the National Institutes of Health Consensus Conference, the risk of HIV infection from a seronegative unit of blood is somewhere between one in 36,000 and one in 100,000. This then is *approximately* the range of the risk of a person's being in the "window" if the person is part of a population where the rate of HIV-positives is one in 1,000. If the rate is one in 10 (as it is at North Carolina Health Department test sites), then the risk of being in the "window" is probably between one in 360 and one in 1,000. Other than laboratory errors, false positives (ELISA plus Western Blot, repeated) are essentially undefinable because of the possibly prolonged phase from initial viremia to clinical disease and the unreliability of virus isolation. These difficulties may be lessened by use of HIV-Ag EIA.⁸

It is equally difficult to accurately evaluate counseling condom use in preventing transmission of HIV. A 17% conversion rate has been observed³ in discordant heterosexual couples who have been properly counseled and who were considered to be highly motivated. Failure to use a condom occurs in 37.5%⁹ of such couples, and one may anticipate that the conversion rate eventually will at least approach one-third. Even assuming total compliance with

condom use, the rate of condom failure is almost certainly higher than the rate of false-negatives and can reasonably be calculated at 1% as a minimum.

However, there is no acceptable risk level for sexual transmission of HIV. If the rate of HIV prevalence in any given population is one in 1,000, then that represents the maximum risk rate for the transmission of HIV between any two persons of unknown HIV status engaging in a single unprotected sexual encounter. If these persons use a condom we assume that risk to have been reduced a hundredfold to one in 100,000. If those two persons are tested negative for HIV, then we assume that risk of transmission to be reduced to one in 5 million. If those two persons both test negative for HIV and use a condom then that risk should be reduced to one in 5 billion. If they continue to maintain a monogamous relationship for six months and avoid other sources of contamination and are again tested negative, their chances thereafter of transmitting the virus between themselves so long as they maintain that status should be close enough to zero for it to be acceptable that they might abandon the use of the condom and engage in either vaginal or anal intercourse as they might wish, and even conceive a child. ■

Medical Origins of Duke University?

Edward C. Halperin, M.D.

A recent letter to the editor of the *Southern Medical Journal* by Dr. H.I. Newbold, a medical nutritionist and widely published author,¹ proposes a bold hypothesis to explain the origin of Duke University.² The biographies of James B. Duke (figure 1) indicate that he died in 1925 of pernicious anemia. Dr. Newbold reports that "as a student at Duke University, I recall having come across books in the reference room of the University Library that were from James B. Duke's personal library. He had made notes in the margins of many of the books, and it was obvious from reading the notes that James Duke was in fact depressed." Dr. Newbold argues that the depression may have been the result of pernicious anemia. He then concludes that it is well known that depressed individuals feel guilty and often try to lessen their guilt by giving things away. "In all probability James B. Duke left the money to found Duke University in an attempt to lessen his depression . . . [had Duke been treated for pernicious anemia] the man not only would have lived but in all probability would have lost his depression and might not have left the money to found Duke University."

There is nothing the medical historian likes more than a good puzzle to solve. Dr. Newbold's hypothesis calls for detective work and a careful evaluation. Does Duke University owe its existence to pernicious anemia? To answer this question we must first answer three others.

1 Did James B. Duke have pernicious anemia?

Biographies of James B. Duke report that he suffered from pernicious anemia and that this condition contributed to his death in 1925.³⁻⁶ In 1926, Drs. George R. Minot and W.P. Murphy of Boston reported the successful treatment of pernicious anemia by a diet rich in liver.^{7,8} For this work, Minot and Murphy shared the 1934 Nobel Prize in medicine with Dr. G.H. Whipple.⁹ The conventional wisdom, repeated by Dr. Newbold, is that Duke died around the time of the discovery of a successful treatment for his disease.

Division of Radiation Oncology, Department of Radiology, Box 3085, Duke University Medical Center, Durham 27710. Dr. Halperin is a recipient of an American Cancer Society Clinical Oncology Career Development Award.

The conventional wisdom may be wrong. On March 17, 1945, Dr. Fredric M. Hanes, chairman of the Department of Medicine at Duke University, wrote to Dr. Minot:¹⁰

"We were discussing the other day the cause of death in the case of Mr. James Buchanan Duke. Someone mentioned that he died from pernicious anemia and Dr. Davison [Dean of the Medical School] said that he didn't believe you thought so. I am writing to ask if you would be good enough to give me a note on this, telling us so far as you can what type of anemia Mr. Duke suffered from."

On March 21, 1945, Dr. Minot responded to Hanes's inquiry:

"Although I never saw Mr. James Buchanan Duke myself, I did see his blood in August, 1925 and reported to Dr. Edwin A. Locke, my associate, about it. I understand that Mr. Duke died in October of that year."

Figure 1. James Buchanan Duke (Photograph courtesy of the Duke University Archives)

I do not believe that he died of pernicious anemia. I think Mr. Duke suffered from one of those fundamental disorders of blood formation that have been commonly called aregeneratory anemias, conditions that sometimes have been called aplastic anemia but not with an anatomical aplasia of the marrow so that it was fatty but where the marrow was red but inactive.

At the time I saw the blood I thought he might have had a so-called aleukemic leukemia. I think today most of the cases called aleukemic leukemia when there is a severe anemia that has developed over months are apt to be so-called aregeneratory anemia which has been discussed by Rhoads of New York. Mr. Duke apparently never had any tongue symptoms and never had any evidence whatsoever of combined system disease, a most unusual event for a man with severe anemia of the pernicious sort at his age. He showed no changes in bone conduction and there was no persistent paresthesia at all. As I understand the record, he was only sick in all about eight or nine months and that is an unusually short course for a pernicious anemia and it is very unusual to have had no improvement.

It might interest you to know that he had broiled liver daily recommended to him (by myself via a letter to Locke) and that would have been about eight months before I read my report at the Association of Physicians. Although he did not have anything like the amount of liver that one would give a patient today, he did have enough liver to have permitted at least some response and he had no response at all.

. . . It is interesting to note that I advised that he have generous amounts of fresh strawberries even if he had to buy them from the Ever-Bearing strawberry farms. I mention that because I used to think that pernicious anemia patients should eat liberally of strawberries because I thought they were helpful, the reason being because strawberries could help people with sprue. At all events, I do remember having Dr. Locke tell me that the patient enjoyed his strawberries.

I also want to emphasize that I think it is very unusual for patients with pernicious anemia to go straight on down hill to death in a course of eight months and that alone would make me mighty suspicious that the patient did not have pernicious anemia, and my blood observations did not distinctly suggest that disease to me."¹¹

Dr. Edwin Allen Locke, referred to in Minot's letter, was born in 1874. He graduated from Harvard Medical School in 1901. Dr. Locke practiced Internal Medicine at his Beacon Street office in Boston and was a Clinical Professor of Medicine at Harvard.¹² Minot also mentions "Rhoads of New York." This was undoubtedly Cornelius Packard "Dusty" Rhoads. Dr. Rhoads was born in 1898 and educated at Bowdoin College and Harvard Medical School. In

1940 Rhoads succeeded James Ewing as Director of Memorial Hospital in New York. He was instrumental in the establishment of the Sloan-Kettering Institute in 1948. Rhoads conducted research on the nature, toxicity, and protection against poisonous gases during World War II. In 1950 Rhoads published his classic paper on the treatment of neoplastic diseases with nitrogen mustard.^{13,14}

The term "aregeneratory anemia" referred to an anemia resulting from a failure of red cell production as opposed to a hemolytic anemia or a blood loss anemia. Aregeneratory anemia was a general term which could have been used to encompass aplastic anemia, pernicious anemia, pyridoxine-deficiency anemia, myelodysplastic syndromes, or an early leukemia. Minot clearly was disinclined to diagnose pernicious anemia in Mr. Duke's case. Since Minot, who won the Nobel Prize for his work in pernicious anemia, discounted the diagnosis in Mr. Duke's case, serious doubt must be cast upon any hypothesis of Duke's actions based upon this diagnosis.

2 Was Duke depressed?

Depression is a mental state characterized by dejection, lack of hope, and absence of cheerfulness.¹⁵ The last year of Mr. Duke's life was characterized by his usual industriousness and energy. In March of 1925 James B. Duke, Trinity College President William Preston Few, and their associates met in Durham to plan the development of Duke University. Dr. Watson Rankin, state public health officer for North Carolina, recalled inspecting the land for the new university with Mr. Duke.

"We walked all over those grounds, jumping ditches and crossing wagon roads and going through shrubbery and all that kind of thing, with Mr. Duke always in the lead. Again I was impressed with the man's vigor."¹⁶

Duke participated actively in planning and construction of the new university, including such details as landscaping and the selection of the stone to be used in the construction of the buildings.⁵ In July 1925 Duke traveled to Canada by rail to inspect a power station. Traveling companion Roy Hunt, later to become president of the Alcoa aluminum company, reported Duke to be a "soft-spoken . . . courteous Southern gentleman . . . very friendly and very keen."¹⁷ These two eyewitness accounts from 1925 give little credence to the assertion that Duke, who died in October, was depressed.

There are no records in the Duke University Library indicating that the University ever possessed, or now possesses, any of Mr. Duke's books. This is confirmed by the Duke University Archivist¹⁸ and the Assistant Curator of the Manuscript department.¹⁹ It is doubtful that James B. Duke ever possessed any significant personal library. He was devoted to his business and non-business reading was not one of his pastimes. Dr. Newbold's assertion that margin

notes in Duke's books indicated depression cannot be independently verified.

3 Did James B. Duke engage in philanthropy to lessen feelings of guilt and depression?

Washington Duke and his son Benjamin Duke first became involved with Trinity College in the late 19th century. In 1887 Benjamin Duke gave the nearly bankrupt institution \$1000. Washington Duke personally guaranteed \$50,000 toward Trinity's endowment in 1890. This helped ensure the institution's move from Randolph County, North Carolina, to Durham.⁴ James B. Duke made his first major donation to Trinity College in 1900 — a new library.²⁰ Over the following years, the Duke family made many donations of time and money to Trinity College. The donations of James B. Duke eventually surpassed those of his father and brother but they clearly continued a family tradition of support to Trinity College — recognized, in part, by changing the name of the expanded school to Duke University..

Washington Duke and his sons supported many worthy causes with charitable donations. These included institutions of higher learning in North and South Carolina, orphanages, the Methodist Church, and hospitals.⁴ In this context, James Duke's donation to found Duke University was not the isolated act of a depressed individual but rather the continuation of a family tradition of philanthropy.^{4,5}

Conclusion

The historical record does not substantiate the hypothesis that depression related to pernicious anemia played any role in the founding of Duke University. The opinion of Dr. Minot makes it unlikely that Mr. Duke suffered from pernicious anemia. There is no verifiable evidence that Mr. Duke was depressed and considerable evidence to the contrary. Duke University owes its founding to long established intentions of James B. Duke and his family. ■

Acknowledgments

Ms. Donna Stephenson typed the manuscript. This work was supported by a grant from the Josiah Charles Trent Memorial Foundation. I am grateful for the helpful com-

ments of Professors R.F. Durden, J. Gifford, Jr., W. King, W. Rundles, J. Sokal, and Ms. E.G. Gartrell.

Heberden's Nodes:

Bony enlargements that form on the dorsomedial and dorsolateral aspects of the distal interphalangeal joints. Occurring with osteoarthritis, they develop slowly over the course of years and usually do not appear before age 40. Although usually asymptomatic, the accompanying arthritis may produce varying disabilities including pain and limitation of joint mobility.

William Heberden was born in London in August, 1710. One of six children, he was headed for a career as a merchant after grammar school due to "the somewhat straitened circumstances" of his family. At age seven, the same year his father died, he entered the Southwark Grammar School, where he displayed such talent in the classics that by age 14 he was able to enter St. John's College in Cambridge. He completed his studies for a Bachelor's degree and then a Master's degree in Arts by age 22, meanwhile beginning his study of medicine at age 20. Heberden worked nine years in Cambridge and London as a Fellow of Cambridge University, receiving the Doctor's degree in Medicine at age 29. In his medical practice, Heberden began his lifelong habit of keeping copious and detailed notes, made at the bedsides of his patients. Each month he carefully reviewed his observations and added to them. These notes were published after his death by his son as the now famous "Commentaries on the History and Cure of Diseases."

Heberden's annual course of lectures on materia medica included discussions on the many common herbs, spices and vegetables in medicinal use. His knowledge of these plants led him to write "Antitheriaca: an Essay on Mithradatum and Theriaca." This concoction — 20 leaves of rue, one grain of salt and two dried figs — was believed to be the universal antidote to poison. Heberden pointed out that none of the poisons known in 100 B.C. (hemlock, monkshood and the venom of poisonous animals) would have been overpowered by salted figs and rue leaves and that Mithradatum and Theriaca was worthless as an antidote. Despite this argument, the recipe remained registered in the Pharmacopoeia of the Royal College of Physicians for another 50 years.

By 1752, at the age of 42, Heberden had obtained a grant of arms, and felt himself to be sufficiently established in his station to take a wife. Elizabeth Martin was 24 at that time and bore two sons before her untimely death two years later. Six years later, Heberden married Mary Wollaston. Together they had eight children. One, Dr. William Heberden, Jr., followed in his father's footsteps except that he took his medical degree from Oxford at age 28.

Heberden's reputation continued to grow. In 1761, George III (who "lost" the American colonies) wished to appoint Heberden as Physician to Queen Charlotte. This honor Heberden declined, saying "it might interfere with those connections of life" he had formed. One such connection had been formed when Heberden joined Benjamin Franklin's crusade against small-pox. Franklin, whose son Francis had died of the disease, devoted himself to the cause of small-pox inoculation. Heberden had established the difference between small-pox and chicken-pox; Franklin contacted him for help. In his usual selfless manner, Heberden wrote and paid for the printing and distribution of an anonymous pamphlet of instructions for inoculation. But Franklin wrote a pamphlet to accompany Heberden's giving full credit where it was due.

Elected a fellow in the Royal College of Physicians in 1746, Heberden urged his fellow members to rely on their own clinical observations and on study of the works of Bacon, Harvey and Newton rather than on the dogmatic teachings of the ancients, Hippocrates and Galen. In 1766 Heberden founded the Medical Transactions of the Royal College of Physicians. These Transactions were based on papers read to and discussed by the College, and as such became one of the earliest medical journals. Only three volumes of these Transactions were printed, to which Heberden contributed 16 papers. One of the most notable, "Some Account of a Disorder of the Breast," was presented July 21, 1768, and is the first known description of angina pectoris to a medical group.

In 1782 at age 73, Heberden went into retirement. That same year it is believed that he finished his "Commentaries." Included in this work is a brief chapter on "Nodi Digtorum," in which he asks:

"What are those hard little knobs, about the size of a small pea, which are frequently seen upon the fingers, particularly a little below the tip, near the joint? They have no connexion with the gout, being formed in persons who never had it; they continue for life; and being hardly ever attended with pain or dispose to become sores, are rather unsightly, than inconvenient, though they must be some little hindrance to the free use of the fingers." ■

and advertised CONTINUOUSLY in the N.C. Journal since January 1940 issue.*

Letters to the Editor

Dr. Wallenborn gives us a look at the past

To the Editor:

This is a picture taken around 1910 of the North Carolina Board of Medical Examiners. It was taken at the Biltmore Estate in Asheville, and my mother identifies the physicians as follows (from left to right: Dr. Hayes from Oxford, NC; Dr. W. White McKenzie from Salisbury, NC; Dr. Bynum from Winston-Salem, NC; Dr. L.B. McBrayer from Asheville, NC; Dr. Dotson from Greensboro, NC; and Dr. Rodman from Washington, NC. Dr. W. White McKenzie was my grandfather and his great grandson now practices otolaryngology/head and neck surgery in Asheville, NC: Peter A. Wallenborn III, M.D.

I made this copy from the original which is in amazingly good condition.

One of my very dear friends, and fellow photographer and skier, is Dr. Charles E. Harrison, Jr., who was one of your residents. At one time I had been a resident in Internal Medicine under Drs. Burnett and Welt at Chapel Hill, and we used to have joint conferences with your department. Needless to say, I remember them well.

I hope you will enjoy looking at the picture.

White McK. Wallenborn, M.D.

On delayed reactions to buried silk sutures

To the Editor:

In the past, buried silk sutures were a mainstay of neurosurgery. Historically, Kocher began using silk sutures because of the high infection rate he experienced with cat-

gut. Halsted then adopted silk as a suture and established some basic principles for its surgical use. Subsequently, Cushing premiered the use of silk in neurosurgery.

More recently, much has been written concerning the problems associated with silk suture use. Postlethwait pub-

lished several papers detailing the tissue reaction seen as a response to silk.¹ In addition, J.E. Dunphy's group studied the relationship between silk and postoperative wound infections.²

Following the implantation of silk, a range of types of tissue reactions can be seen. Initially, there is an acute reaction, followed by deposition of fibrous tissue around the suture. usually, this fibrous tissue encapsulation surrounds a granulomatous type reaction consisting of histiocytes, fibroblasts, giant cells, and lymphocytes. The amount of cellular invasion between the silk fibers varies and seems to increase with time. This response is usually not clinically apparent and does not interfere with successful wound healing. When an amplified response occurs, it generally presents as a draining tract or superficial area of inflammation along the suture line during the immediate post operative period. Delayed reactions are less common, but can occur years after the initial placement of the silk suture.

The use of silk, especially for approximating subcutaneous tissues has declined over the past several years in favor of absorbable synthetic polymers with equal or better tensile strength and knot stability.³ With the increasing use of the absorbable synthetic polymers, the foreign body reactions seen with the use of silk will become more rare. However, since these modern suture materials have been developed only recently, there are many patients today who have been closed with silk.

In spite of the large body of patients bearing indwelling silk sutures, recently trained individuals may not be aware of the many properties of silk. Foreign body reaction to silk sutures should be included in the differential diagnosis of patients who present with wound breakdown or apparent wound infection. Because the reaction to silk is an ongoing phenomenon, the correct diagnosis is important so that removal of all silk sutures can be performed. As mentioned earlier, these reactions can occur years after the initial placement of the silk sutures.

On the first "Names and Faces of Medicine"

To Doctors Lurie and Neelon:

Your article concerning Baron Guillaume Dupuytren (48:452) was very interesting. He was a giant in his time and a great surgeon. However, one of the salient points of his surgical teachings has been overlooked or by purpose.

It was he to whom the honor goes of first being allowed to deny the entity of appendicitis. When one of his students brought this up as a possibility of an entity, he was so vehemently censored that the poor student from that day on assumed anonymity in the medical field. It was some years later before the entity of appendicitis was recognized in the medical profession. It was due to this point that one of our professors used to say that "As students you have to remember that some day you might have to go giant killing." I merely point this out to recognize the fact and bring to the forefront the point that regardless of how great a person is, he is still only human.

Thank you.

Some thoughts on Medical Review of North Carolina

To the Editor:

I am enclosing a letter I have written to Dr. Ralph Snyder of the Medical Review of North Carolina over a particular judgment rendered by this peer review organization operating under guidelines and contract from the federal Health Care Financing Administration.

Prior articles and letters have appeared in the *Journal* describing, discussing, castigating, and defending this operation.

The goals of "cost containment" review for appropriate hospitalization, documentation of quality and outcome and identification of "poor" practitioners are commendable. Of course any "system" has its weaknesses and "protocols" and "guidelines" are based on labels, diagnoses, averages, intervals, and other statistical tools and are bound to be imperfect — just as on line clinical judgment is.

A question that comes to my mind is whether the quality/peer review idea is being driven by any motivation other than "cost containment" and whether the costs contained are matched by the costs engendered by this operation. It is very difficult as a non-accountant to understand what is being "saved." Maybe you can stimulate a regular "accounting" by this group with their "attack rate" or cases "denied," "appealed," "sustained" and the cost of doing such business with the perceived "savings." The current system with "denials" impacting our hospitals, which are doing so extremely well on the DRG system, seems to be a nuisance for the physician. Does it do anything else?

Meanwhile I am collecting some interesting "war stories" of MRNC activities, as experienced by other on line physicians. I would be pleased to receive communications describing these interactions. This archive will be interesting to a future historian describing the evolution of the system of health care in this country. This collection will not be shredded.

Perhaps our profession can find leaders who will help our

society work out its health and sickness care delivery in a more effective, humane and economic way.

James A. Bryan II, M.D.
University of North Carolina
Department of Medicine
Division of General Medicine and Clinical Epidemiology
Old Clinic Building 226 H
Chapel Hill 27514

Dr. Bryan's letter to Dr. Snyder at MRNC:

Your "personal and confidential" letter, written in classic bureaucratese, has arrived informing me that "quality issues" involved have earned a "Severity Level Index of 4,"* and that reimbursement for one of the subsequent hospitalizations for the patient will be denied.

Whether my hospital wants to "appeal" is up to them. I would certainly be willing to "appeal" but have no zeal in arguing with your organization on what is seen through the retrospectroscope. The purported "premature discharge" of a steroid-dependent COPD patient with severe pain problems from her osteopenia was a clinical judgment arrived at between me and her primary pulmonologist. Even though the patient did return within a short time, the possibility that she might do so had been taken into account. This lady, fighting for time at home and with an available and responsive primary lung physician, indeed bounced back because of the agreed upon pain control maneuvers.

Medicine continues to be individual and empiric — I wish clinical judgment were perfect. As far as I am concerned you can remove the personal and confidential designation from any future correspondence as I will probably attempt to make them public.

*Whatever that means — you inform me that "Copies of MRNC's Quality of Care Review and Sanction Protocols have been provided to your hospital. We urge you to familiarize yourself with these procedures." Your protocols don't interest me.

James A. Bryan II, M.D.

In appreciation of our special issue on breast cancer

To the Managing Editor:

On behalf of the American Cancer Society, North Carolina Division, I am writing this letter to thank you and Dr. Stead for encouraging the development of the October issue of the North Carolina Medical Journal (48[10]) on breast cancer.

We sincerely appreciate the contributions of the professionals who submitted articles and Dr. Robert Sandler who served as guest editor.

As you mentioned, Dr. Sandler is the chairman of the North Carolina Division's Professional Education Committee and the chairman of our three-year Task Force on Breast Cancer Detection Awareness.

As part of the BCDA program, a speaker's bureau has been established and includes the names of more than 40 professionals who are available to speak at no charge, at county medical societies, AHEC's and other organizations. Anyone who is interested should contact me at our Raleigh office.

Also, the October issue was utilized immediately to provide background and reference material following Nancy Reagan's recent breast surgery. It provided information for the news media. Reprints of the articles will be distributed by us to professionals and participants in many of our medical conferences.

The service that this issue has performed for the community may seem intangible to many in the short term. We are sure, however, that the long-range benefit to breast cancer patients in North Carolina will only mean better patient care because physicians will be better informed on breast cancer diagnosis and treatment.

AUTHORS

INSTRUCTIONS FOR SUBMITTING PAPERS

Copyright of an article published in the *North Carolina Medical Journal* is retained by the author, but the copyright to each entire issue is the property of The North Carolina Medical Society, and permission to reprint all or any part of a published article must be negotiated with the author and the editor jointly. The reprinted material must carry a credit line signifying that it appeared in the *North Carolina Medical Journal*.

Medical articles, editorials, patient oriented articles, letters to the editor and all other text submitted for publication must be double-spaced throughout, including references and legends. The material should be typed on one side of the paper with 1¼ inch margins all around. Do not use an all-caps or a script typeface. Submit one original and one copy. Please be sure to include your phone number.

The author is responsible for the accuracy of all statements and references. Acronyms and other abbreviations should be kept to a minimum; *any acronym used should be fully translated in the text*. Refer to pharmaceutical products by their generic names; brand names may follow in parentheses. Units of measure should appear in the metric system. References, typed double-spaced, should be listed in the order of their citation in the text, not alphabetically. They should follow the style used in the *Journal*.

Illustrations should be black and white glossy prints or color or black and white slides, with legends typed in double-space on a separate sheet of paper. Since the *Journal* has a limited budget for color, it may be a factor in publishing color illustrations.

Attach to the two copies of the manuscript a cover letter giving the address and telephone number of the person who will correspond about it, and address the completed communication to the Editor, Box 3910, Duke University Medical Center, Durham, NC 27710.

All manuscripts are subject to editorial changes. If extensive revision is necessary, the author may be sent a draft of the edited article for approval before publication. The author will be sent galley proofs if the paper is published.

Authors interested in more effective writing may find *The Elements of Style* by Strunk and White and *How to Write and Publish a Scientific Paper* by Day helpful.

Extracted, with permission, from *Virginia Medical* with thanks.

Please specify the number of issues in which you'd like it to appear. Include your name, address, and phone number.

Closing date is the 25th of the second prior month. For cost and billing information, call 919/684-5728.

FP, GP, PED

Needed now to work with a unique, internationally respected rural health system network in Kentucky which includes a hospital, satellite clinics, a home health agency and a school of advanced nursing. A regional medical center is within 20 miles. The practice environment is stimulating - physicians and Advanced Registered Nurse Practitioners work in joint practice teams; interaction with students is encouraged; the rural population presents a wide range and intensity of medical problems.

The FP or GP will be expected to share call with specialists and consequently must have particular strength in one of the following areas: Pediatrics, Obstetrics, Emergency Medicine or Internal Medicine.

The setting is in heavily-wooded mountains with a moderate 4-season climate. Seven state parks are within 80 miles.

Superior compensation/benefits package includes a guaranteed salary with incentives and malpractice. Call Deborah Pennington COLLECT at 1-502-897-2566. This is an Equal Opportunity Employer.

PHYSICIANS— PRIMARY CARE CLINIC

Jacksonville, N.C.

Positions available. Family practice, general practice, pediatrics or gyn.

A competitive salary and benefit program is offered. Please call:

**T.W. Kitchen, M.D.
Medical Director
919-455-7499**

TELL YOUR PATIENTS THEIR CHOLESTEROL NUMBER... BEFORE THEY ASK.

Reducing high blood cholesterol reduces the risk of heart disease. That's why we're telling Americans—through a national public service advertising campaign—to know their cholesterol number. Your patients may soon be asking you for their number and what it means.

And when they do, we can help. The National Cholesterol Education Program, administered by the National Heart, Lung, and Blood Institute, has developed adult treatment guidelines to help you identify high-risk patients and use the appropriate diet and/or drug therapy for those with elevated cholesterol levels.

Help your patients reduce their risk of heart disease. For a free copy of the *Report of the Expert Panel on Detection, Evaluation, and Treatment of High Blood Cholesterol in Adults*, complete the form below.

THE FUTURE IS NOW WITH THE ELIMINATOR

"Eliminator" is a fairly harsh word to describe an x-ray generator. However, the Compu-mAs system from Bennett X-Ray Corp. and B & B X-Ray does so many things for you, there's no other word to explain it. The generator automatically calculates the next available mAs from the 34 time stations and the 7 mA stations, therefore eliminating many of the steps that were once necessary in taking x-rays.

The Compu-mAs:

- Eliminates setting major and minor kVp tap switches
- Eliminates setting high and low range for kV selectors
- Eliminates calculating mA \times time to find mAs
- Eliminates checking and adjusting line compensation
- Eliminates the need to set both mA and time

By eliminating all of these steps, the Eliminator moves into the future without sacrificing dependability and accuracy. Dependability has been a benefit of owning a Bennett Radiographic System for over 30 years. And now, by automatically selecting the next available mAs combination of mA and time, Compu-mAs provides accuracy to almost infinite resolution. The Compu-mAs Eliminator—just another way B & B X-Ray is working for your end result, optimum quality radiographs.

In acute and chronic edema due to CHF

FOR PREDICTABLE CONTROL

- **Less potassium loss for a given amount of sodium excretion than with furosemide¹⁻³**
- **Predictable dose response⁴**
- **Diuresis completed hours faster than with furosemide after oral dosing⁵**
- **Better GI absorption^{6,7}**
- **Early evening dosing helps prevent nocturnal dyspnea**

As with all loop diuretics, excessive doses of BUMEX can lead to profound diuresis with water and electrolyte depletion, including hypokalemia, so serum electrolytes should be monitored.

Bumex[®]

bumetanide/Roche

0.5-mg, 1-mg and 2-mg scored tablets; 2-ml ampuls and 2-ml, 4-ml and 10-ml vials [0.25 mg/ml]

BUMEX[®]
(bumetanide/Roche)
0.5-mg, 1-mg and 2-mg scored tablets
2-ml ampuls, 2-ml, 4-ml and
10-ml vials (0.25 mg/ml)

Before prescribing, please consult complete product information, a summary of which follows:

WARNING: Bumex (bumetanide/Roche) is a potent diuretic which, if given in excessive amounts, can lead to a profound diuresis with water and electrolyte depletion. Therefore, careful medical supervision is required, and dose and dosage schedule have to be adjusted to the individual patient's needs. (See under **DOSAGE AND ADMINISTRATION** in complete product information.)

INDICATIONS AND USAGE: Edema associated with congestive heart failure, hepatic and renal disease, including the nephrotic syndrome.

Almost equal diuretic response occurs after oral and parenteral administration of Bumex. If impaired gastrointestinal absorption is suspected or oral administration is not practical, Bumex should be given by the intramuscular or intravenous route.

Successful treatment with Bumex following instances of allergic reactions to furosemide suggests a lack of cross-sensitivity.

CONTRAINDICATIONS: Anuria. Hypersensitivity and in patients in hepatic coma or in states of severe electrolyte depletion. Although Bumex can be used to induce diuresis in renal insufficiency, any marked increase in blood urea nitrogen or creatinine, or the development of oliguria during therapy of patients with progressive renal disease, is an indication for discontinuation of treatment.

WARNINGS: Dose should be adjusted to patient's needs. Excessive doses or too frequent administration can lead to profound water loss, electrolyte depletion, dehydration, reduction in blood volume and circulatory collapse with the possibility of vascular thrombosis and embolism, particularly in elderly patients.

Prevention of hypokalemia requires particular attention in patients receiving digitalis and diuretics for congestive heart failure, hepatic cirrhosis and ascites, states of aldosterone excess with normal renal function, potassium-losing nephropathy, certain diarrheal states, or other states where hypokalemia is thought to represent particular added risk to the patients.

In patients with hepatic cirrhosis and ascites, sudden alterations of electrolyte balance may precipitate hepatic encephalopathy and coma. Treatment in such patients is best initiated in the hospital with small doses and careful monitoring of the patient's clinical status and electrolyte balance. Supplemental potassium and/or spironolactone may prevent hypokalemia and metabolic alkalosis in these patients. In cats, dogs and guinea pigs, Bumex has been shown to produce ototoxicity. Since Bumex is about 40 to 60 times as potent as furosemide, it is anticipated that blood levels necessary to produce ototoxicity will rarely be achieved. The potential for ototoxicity increases with intravenous therapy, especially at high doses.

Patients allergic to sulfonamides may show hypersensitivity to Bumex.

PRECAUTIONS: Measure serum potassium periodically and add potassium supplements or potassium-sparing diuretics, if necessary. Periodic determinations of other electrolytes are advised in patients treated with high doses or for prolonged periods, particularly in those on low salt diets.

Hyperurcemia may occur. Reversible elevations of the BUN and creatinine may occur, especially with dehydration and in patients with renal insufficiency. Bumex may increase urinary calcium excretion. Possibility of effect on glucose metabolism exists. Periodic determinations of blood sugar should be done, particularly in patients with diabetes or suspected latent diabetes.

Patients should be observed regularly for possible occurrence of blood dyscrasias, liver damage or idiosyncratic reactions.

Especially in presence of impaired renal function, use of parenterally administered Bumex should be avoided in patients to whom aminoglycoside antibiotics are also being given, except in life-threatening conditions.

Drugs with nephrotoxic potential and bumetanide should not be administered simultaneously. Since lithium reduces renal clearance and adds a high risk of lithium toxicity, it should not be given with diuretics.

Probenecid should not be administered concurrently with Bumex.

Concurrent therapy with indomethacin not recommended.

Bumex may potentiate the effects of antihypertensive drugs, necessitating reduction in dosage.

Interaction studies in humans have shown no effect on digoxin blood levels.

Interaction studies in humans have shown Bumex to have no effect on warfarin metabolism or on plasma prothrombin activity.

Pregnancy: Bumex should be given to a pregnant woman only if the potential benefit justifies the potential risk to the fetus.

Bumetanide may be excreted in breast milk.

Pediatric Use: Safety and effectiveness below age 18 not established.

ADVERSE REACTIONS: Muscle cramps, dizziness, hypotension, headache and nausea, and encephalopathy (in patients with preexisting liver disease).

Less frequent clinical adverse reactions are weakness, impaired hearing, rash, pruritus, hives, electrocardiogram changes, abdominal pain, arthritic pain, musculoskeletal pain and vomiting. Other clinical adverse reactions are vertigo, chest pain, ear discomfort, fatigue, dehydration, sweating, hyperventilation, dry mouth, upset stomach, renal failure, asterixis, itching, nipple tenderness, diarrhea, premature ejaculation and difficulty maintaining an erection.

Laboratory abnormalities reported are hyperurcemia, azotemia, hyperglycemia, increased serum creatinine, hypochloremia, hypokalemia, hyponatremia, and variations in CO₂ content, bicarbonate, phosphorus and calcium. Although manifestations of the pharmacologic action of Bumex, these conditions may become more pronounced by intensive therapy.

Diuresis induced by Bumex may also rarely be accompanied by changes in LDH, total serum bilirubin, serum proteins, SGOT, SGPT, alkaline phosphatase, cholesterol, creatinine clearance, deviations in hemoglobin, prothrombin time, hematocrit, platelet counts and differential counts. Increases in urinary glucose and urinary protein have also been seen.

DOSAGE AND ADMINISTRATION:

Oral Administration: The usual total daily dosage is 0.5 to 2.0 mg and in most patients is given as a single dose.

Parenteral Administration: Administer to patients (IV or IM) with GI absorption problem or who cannot take oral. The usual initial dose is 0.5 to 1 mg given over 1 to 2 minutes. If insufficient response, a second or third dose may be given at 2 to 3 hour intervals up to a maximum of 10 mg a day.

HOW SUPPLIED: Tablets, 0.5 mg (light green), 1 mg (yellow) and 2 mg (peach), bottles of 100 and 500; Prescription Packs of 30; Tel-E-Dose[®] cartons of 100. Imprint on tablets: 0.5 mg—ROCHE BUMEX 0.5; 1 mg—ROCHE BUMEX 1; 2 mg—ROCHE BUMEX 2.

Ampuls: 2 ml, 0.25 mg/ml, boxes of ten.

Vials: 2 ml, 4 ml and 10 ml, 0.25 mg/ml, boxes of ten.
